Microdermabrasion

What is Skin Resurfacing?

Resurfacing is a technique for removing the topmost layer of skin leaving it supple and vibrant. The DiamondTome Wand removes this layer of skin by gently exfoliating the skin with natural diamond chips, while at the same time vacuuming the dead skin cells away in a sterile and controlled manner. Removing this outer layer of dead skin cells leaves a smoother texture and promotes the growth of healthy new skin cells.

Advantages of DiamondTome Wands

Resurfacing is a wonderful alternative to laser or chemical peels because it is non-invasive, non-surgical and requires no down time after treatment. Normal activities may be resumed immediately. Your skin will have a radiant glow, free of irritation and loose particles. Patients experience softer, smoother and cleaner skin after the first treatment. Treats extraction of blackheads and whiteheads, oily skin, rejuvenation of skin health, minor scar revision, reduction of acne scarring, reduction of minor to moderate early aging fine lines, age spots - hands, and face.

How much discomfort will I experience?

Resurfacing treatments using the DiamondTome system are painless yet effective. The degree of effectiveness is controlled by a widely adjustable vacuum in conjunction with the varying coarseness of the DiamondTome Wands. Your certified medical aesthetician is trained to evaluate the effectiveness of the treatment while at the same time ensuring your comfort.

How will I look after the treatment?

Your skin may look slightly flushed immediately after the treatment but should return to normal in 10-30 minutes. Your skin will look and feel smoother even after the first treatment and will continue to improve with additional treatments.

How many treatments are necessary?

Treatment series vary from four to ten sessions depending on the condition being treated and the type of skin.
