Photofacial

No more unwanted marks.

Cosmetic flaws may be caused by heredity, medication, pregnancy or environmental factors. Yet most vascular and pigmented lesions are ideal candidates for non-invasive AFT pulsed light treatments. The widest range of benign vascular lesions, like port wine stains, telangiectasias, hemangiomas, erythema, and rosacea can be safely and effectively treated with AFT pulsed light. In addition to these signs of photo damage and early aging, AFT rejuvenation improves dull complexions, uneven pigmentation and large pores, as well as red flushing, redness due to broken capillaries and most brown pigmentation (sun-induced freckles).

The AFT Pulsed Light Advantage.

Delivering gentle, subtle improvement, AFT pulsed light gives your skin a younger appearance. Your skin will appear naturally even-toned and healthy, without the artificial look of other cosmetic treatments.

Unlike deep laser resurfacing and chemical peels, AFT pulsed light is not accompanied by an extended period of redness and swelling, nor does it involve ablation of the upper layer of skin.

Is it safe?

AFT's pulsed light's gentle energy parameters assure safe, effective treatment. Uniquely shaped AFT pulses precisely heat the intended targets, causing remarkable little or no skin damage or discomfort. Clinical trials conducted by leading authorities on pulse light document its safety and effectiveness.

Does it hurt?

While pain tolerance is an individual matter, most people tolerate AFT pulsed light treatment well, and describe the sensation as a rubber band snap to the skin. The majority of patients require no anesthesia.

Treatment - what to expect?

AFT photo rejuvenation treatment range from 15 to 30 minutes. First, the treated area is cleansed and a cool gel is applied. The light pulse is then delivered, with little or no discomfort. After treatment, the gel is removed and the skin is cleansed. You can resume all regular activities immediately.

How many treatments are necessary?

Treatments generally involves a series of five sessions. While some patients see significant improvement in two or three treatments, others may require more. To maintain results, patients may opt for follow-up treatments.

Are there any side effects?

Side effects are rare. Immediately following treatment, the skin may appear flushed, brown pigmented spots may appear darker and capillaries may be more visible. To help guarantee the best results, limit your exposure to the sun for several weeks before and after treatment.

Rewards of Skin Rejuvenation

Removes most brown and red pigmentaiton

Improves dull complexions, large pores, red flushing skin and rosacea

Gives skin a smoother, more even-toned look

Little or no discomfort

No downtime
