Keyboard Tray Instructions

Hardware included in standard toolkit:
- M4 socket-head screws (4)
- 3mm hex key

Follow along with the steps listed in the main assembly instructions under "Attaching the bracket to the head enclosure".

1. Power on the keyboard by flipping the toggle next to the Eject button so the green appears.

2. Insert the keyboard into the back of the tray by sliding in the bottom first.

3. Plug in the Apple Lightning cable to the keyboard and thread through the channel in the tray, then through the opening in the keyboard bracket.

4. Attach the keyboard tray to the bracket, aligning the threaded holes. Insert the M4 screws and tighten using the hex key.

5. Insert the keyboard bracket between the kiosk bracket and head enclosure and line up the threaded holes. Make sure the barrel lock is at the bottom. Insert four 12mm screws, tightening with the hex key.

6. Thread the Apple Lightning cable through the bottom of the kiosk bracket, and into the head enclosure, plugging it into your tablet.
