# 1 Revision History

| Date       | Changes       |
|------------|---------------|
| 2015-04-15 | First release |

## 2 Main Features

| Item                 | Specification                             | Unit |
|----------------------|---|------|
| Number of Characters | 20 characters x 4 lines                   |      |
| Display Mode         | STN Positive, Yellow Green, Transflective | -    |
| Module dimension     | 98.0 x 60.0 x 13.6(MAX)                   | mm   |
| Controller IC        | ST7066U                                   | -    |
| Interface            | 6800 Series MPU Interface                 | -    |
| Power Supply         | 5.0                                       | V    |
| View Direction       | 6:00                                      | -    |
| Duty                 | 1/16                                      |      |
| Backlight            | Yellow Green LED                          | -    |
| Weight               | 69.6                                      | g    |

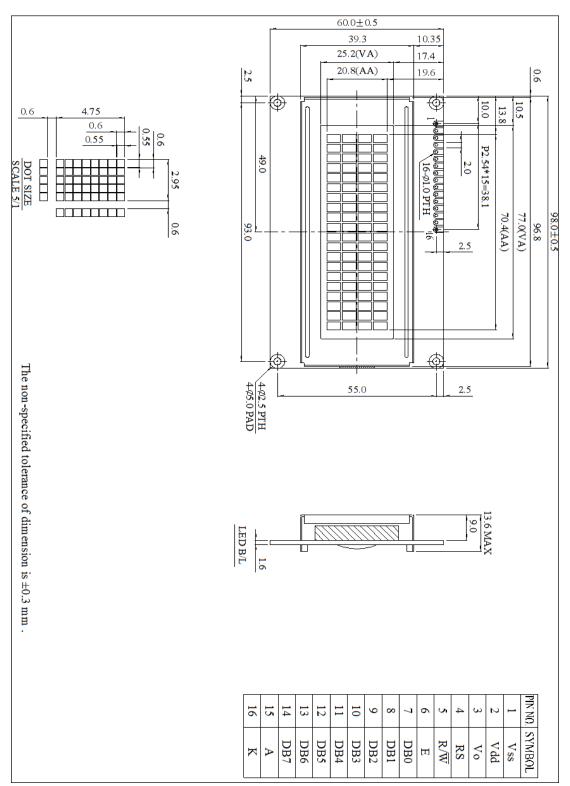

# 3 Pin Description

| Pin No. | Symbol | Description                              |
|---------|--------|--|
| 1       | VSS    | Ground                                   |
| 2       | VDD    | Supply Voltage for logic                 |
| 3       | VO     | Operation voltage for LCD(Variable)      |
| 4       | RS     | H: DATA, L: Instruction code             |
| 5       | R/W    | H: Read(MPU→Module) L: Write(MPU→Module) |
| 6       | Е      | Chip enable signal                       |
| 7       | DB0    | Data bus line                            |
| 8       | DB1    | Data bus line                            |
| 9       | DB2    | Data bus line                            |
| 10      | DB3    | Data bus line                            |
| 11      | DB4    | Data bus line                            |
| 12      | DB5    | Data bus line                            |
| 13      | DB6    | Data bus line                            |
| 14      | DB7    | Data bus line                            |
| 15      | А      | Power supply for B/L(+)                  |
| 16      | K      | Power supply for B/L(-)                  |

### 10 Instruction Description

### **Clear Display**

RS RW DB7 DB6 DB5 DB4 DB3 DB2 DB1 DB0

Code 0 0 0 0 0 0 0 0 1

Clear all the display data by writing "20H" (space code) to all DDRAM address, and set DDRAM address to "00H" into AC (address counter). Return cursor to the original status, namely, bring the cursor to the left edge on first line of the display. Make entry mode increment (I/D = "1").

#### **Return Home**

RS RW DB7 DB6 DB5 DB4 DB3 DB2 DB1 DB0

Code 0 0 0 0 0 0 0 1 x

Return Home is cursor return home instruction. Set DDRAM address to "00H" into the address counter. Return cursor to its original site and return display to its original status, if shifted. Contents of DDRAM does not change.

### **Entry Mode Set**

RS RW DB7 DB6 DB5 DB4 DB3 DB2 DB1 DB0

Code 0 0 0 0 0 0 1 I/D S

Set the moving direction of cursor and display.

#### I/D: Increment / decrement of DDRAM address (cursor or blink)

When I/D = "High", cursor/blink moves to right and DDRAM address is increased by 1.

When I/D = "Low", cursor/blink moves to left and DDRAM address is decreased by 1.

#### S: Shift of entire display

When DDRAM read (CGRAM read/write) operation or S = "Low", shift of entire display is not performed. If S = "High" and DDRAM write operation, shift of entire display is performed according to I/D value (I/D = "1": shift left, I/D = "0": shift right).

| S | I/D | Description                    |
|---|-----|--------------------------------|
| Н | Н   | Shift the display to the left  |
| Н | L   | Shift the display to the right |

### **Display ON/OFF**

RS RW DB7 DB6 DB5 DB4 DB3 DB2 DB1 DB0

Code 0 0 0 0 0 1 D C B

Control display/cursor/blink ON/OFF 1 bit register.

#### D: Display ON/OFF control bit

When D = "High", entire display is turned on.

When D = "Low", display is turned off, but display data is remained in DDRAM.

C: Cursor ON/OFF control bit

<sup>\*</sup> CGRAM operates the same as DDRAM, when read from or write to CGRAM.

When C = "High", cursor is turned on.

When C = "Low", cursor is disappeared in current display, but I/D register remains its data.

#### **B**: Cursor Blink ON/OFF control bit

When B = "High", cursor blink is on, that performs alternate between all the high data and display character at the cursor position.

When B = "Low", blink is off.

### **Cursor or Display Shift**

RS RW DB7 DB6 DB5 DB4 DB3 DB2 DB1 DB0

|  | Code | 0 | 0 | 0 | 0 | 0 | 1 | S/C | R/L | Х | Х |
|--|------|---|---|---|---|---|---|-----|-----|---|---|
|--|------|---|---|---|---|---|---|-----|-----|---|---|

Without writing or reading of display data, shift right/left cursor position or display. This instruction is used to correct or search display data. During 2-line mode display, cursor moves to the 2nd line after 40th digit of 1<sup>st</sup> line. Note that display shift is performed simultaneously in all the line. When displayed data is shifted repeatedly, each line shifted individually. When display shift is performed, the contents of address counter are not changed.

| S/C | R/L | Description  | AC Value |
|-----|-----|--|----------|
| L   | L   | Shift cursor to the left                                     | AC=AC-1  |
| L   | Н   | Shift cursor to the right                                    | AC=AC+1  |
| Н   | L   | Shift display to the left. Cursor follows the display shift  | AC=AC    |
| Н   | Н   | Shift display to the right. Cursor follows the display shift | AC=AC    |

#### **Function Set**

RS RW DB7 DB6 DB5 DB4 DB3 DB2 DB1 DB0

| Code | 0 | 0 | 0 | 0 | 1 | DL | Ν | F | Х | Х |
|------|---|---|---|---|---|----|---|---|---|---|
|      |   |   |   |   |   |    |   |   |   | İ |

### DL: Interface data length control bit

When DL = "High", it means 8-bit bus mode with MPU.

When DL = "Low", it means 4-bit bus mode with MPU. So to speak, DL is a signal to select 8-bit or 4-bit bus mode.

When 4-bit bus mode, it needs to transfer 4-bit data by two times.

#### N: Display line number control bit

When N = Low, it means 1-line display mode.

When N = "High", 2-line display mode is set.

#### F: Display font type control bit

When F = "Low", it means 5 x 8 dots format display mode

When F = "High", 5 x11 dots format display mode.

| N | F | No. of Display Lines | Character Font | Duty Factor |
|---|---|----------------------|----------------|-------------|
| L | L | 1                    | 5 x 8          | 1/8         |
| L | Н | 1                    | 5 x 11         | 1/11        |
| Н | х | 2                    | 5 x 8          | 1/16        |

#### **Set CGRAM Address**

RS RW DB7 DB6 DB5 DB4 DB3 DB2 DB1 DB0

 Code
 0
 0
 1
 AC5
 AC4
 AC3
 AC2
 AC1
 AC0

Set CGRAM address to AC.

This instruction makes CGRAM data available from MPU

#### **Set DDRAM Address**

RS RW DB7 DB6 DB5 DB4 DB3 DB<sub>2</sub> DB<sub>1</sub> DB<sub>0</sub> 1 AC6 AC<sub>5</sub> AC4 AC3 AC2 AC<sub>1</sub> AC<sub>0</sub> Code

Set DDRAM address to AC.

This instruction makes DDRAM data available from MPU.

When 1-line display mode (N = 0), DDRAM address is from "00H" to "4FH".

In 2-line display mode (N = 1), DDRAM address in the 1st line is from "00H" to "27H", and DDRAM address in the 2nd line is from "40H" to "67H".

### **Read Busy Flag and Address**

Code

RS RW DB7 DB6 DB5 DB4 DB3 DB2 DB1 DB<sub>0</sub> BF AC6 AC5 AC4 AC3 AC2 AC1 AC<sub>0</sub> 0 1

When BF = "High", indicates that the internal operation is being processed. So during this time the next instruction cannot be accepted.

The address Counter (AC) stores DDRAM/CGRAM addresses, transferred from IR.

After writing into (reading from) DDRAM/CGRAM, AC is automatically increased (decreased) by 1.

#### Write Data to CGRAM or DDRAM

RS RW DB7 DB6 DB5 DB4 DB3 DB2 DB1 DB0

Code 1 0 D7 D6 D5 D4 D3 D2 D1 D0

Write binary 8-bit data to DDRAM/CGRAM.

The selection of RAM from DDRAM, CGRAM, is set by the previous address set instruction: DDRAM address set, CGRAM address set. RAM set instruction can also determine the AC direction to RAM. After write operation, the address is automatically increased/decreased by 1, according to the entry mode.

#### Read Data from CGRAM or DDRAM

RS RW DB7 DB6 DB5 DB4 DB3 DB2 DB1 DB0

Code 1 1 D7 D6 D5 D4 D3 D2 D1 D0

Read binary 8-bit data from DDRAM/CGRAM.

The selection of RAM is set by the previous address set instruction. If address set instruction of RAM is not performed before this instruction, the data that read first is invalid, because the direction of AC is not determined. If you read RAM data several times without RAM address set instruction before read

operation, you can get correct RAM data from the second, but the first data would be incorrect, because there is no time margin to transfer RAM data.

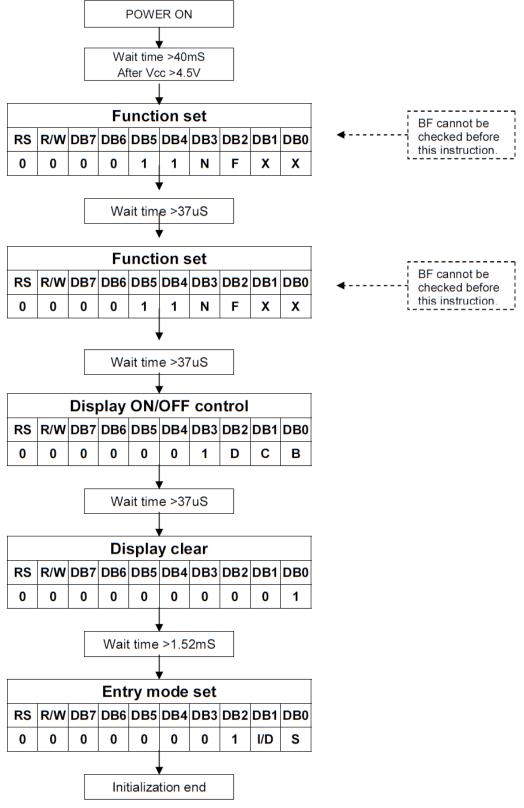

In case of DDRAM read operation, cursor shift instruction plays the same role as DDRAM address set instruction: it also transfer RAM data to output data register. After read operation address counter is automatically increased/decreased by 1 according to the entry mode. After CGRAM read operation, display shift may not be executed correctly.

\* In case of RAM write operation, after this AC is increased/decreased by 1 like read operation. In this time, AC indicates the next address position, but you can read only the previous data by read instruction.

## 11 Initializing by Instruction

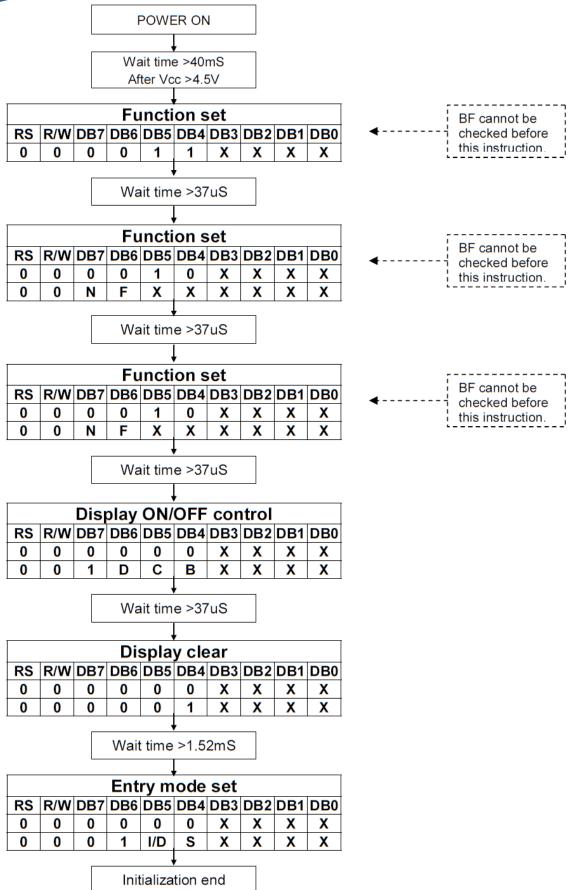

8-bit Interface(focs=270KHz)

4-bit Interface (fosc=270KHz)

## 12 Built-in Font Table

Note1: No dew condensation to be observed.

Note2: The function test shall be conducted after 4 hours storage at the normal. Temperature and humidity after remove from the rest chamber.

Note3: Test performed on product itself, not inside a container
