

Model XL1A for flat Concrete

Model XL2A for rebated Concrete

Model XL2A-Ext for External application

Double Installation

Ram-raid attempt

XTRA-LOK

Roller Door Security Latch Dead Lock for Roller Doors

(Designed and made in Australia)
(from imported & locally made parts)

XTRA-LOK's can be fitted to Roller doors, Tilt a doors, Panel Lift and even sliding shed style doors.

Double installation recommended for doors over 2.4m wide, see bottom photo.

Some commercial Roller doors lock only by the chain, leaving the door easily jimmed up. Others have inadequate slide bolts on one or both sides of the door, leaving the middle the weak point.

Domestic Roller doors are broken into in seconds and these days there is often an entry door into the house from the garage.

XTRA-LOK's secure the door to the concrete with a simple latching technique taking seconds. When unlocked they lay flat to the floor.

XTRA-LOK's help prevent break-ins via the door being jimmed up, or as in a ram-raid situation (see bottom photo), they are also of great assistance in strong wind areas.

XTRA-LOK's are constructed from steel treated with zinc for corrosion resistance. The hinge pin is 304 grade stainless steel for strength and durability.

They are supplied with four hardened tamper-proof concrete fasteners and four cup head bolts. Padlocks not included. For use with the External XTRA-LOK we recommend a Discus padlock (as shown) or another padlock with shackle protection.
