
FUEL FILTER RELOCATOR BRACKET:

- This bracket is used to reposition the fuel filter on Defender Td5 & Puma when using our (or any other) pip to pin rear shock mounts.
- it moves the fuel filter forward to allow room for the shock mount, it bolts to the existing mounting points, you just have to unclip the fuel pipes off the chassis and gently pull them forward, (do not remove the pipes off the fuel filter head), once fitted you can clip the pipes back in place, take care on the puma ones as the pipes are very thin and will kink very .
- Please note sometimes instead of taking right angle routing, the fuel lines will end up taking a more diagonal/direct route to enable the lines to reach the filters new position further away slightly from the fuel tank.
- Pictures speak 1000 words, please see below for how the kit is fitted.
