

# White Lightning® Liquid

## Instructions

Liquid White Lightning® is activated by mixing it with equal parts of white vinegar. This step should be performed in a paper or plastic cup, but **not** in metal as White Lightning® is an oxidizer. White Lightning® is aggressive for 8 hours once mixed with vinegar. After 8 hours it becomes inert. **Never** mix more than you are going to use at one time.

## Hoof Soak

A hoof treatment consists of 2oz White Lightning®, 2oz white vinegar and enough water to cover half way up the hoof wall. Remove shoes, if possible, clean the hoof of dirt and debris. Insert the clean hoof into a heavy plastic bag or Disposable Vapor/Soak Boots, containing the activated White Lightning® solution and secure the top around the leg to prevent the escape of the gas produced by the activated White Lightning® (vet wrap around the top of the soak boot works well.) Stand your horse in the bag/boot for at least 40-45 minutes. Repeat 2-3 times per week for the first 4-6 weeks. Then 1-2 times per week until the hoof is completely grown out. Treat once a month after the hoof has grown out to help keep White Line Disease away.

**Caution:** *Do not mix any other product with White Lightning® as this could cause an undesirable chemical reaction. White Lightning® liquid may discolour hair or clothing.*
