## General Description

Each of these monolithic counters contains four masterslave flip-flops and additional gating to provide a divide-bytwo counter and a three-stage binary counter for which the count cycle length is divide-by-five for the 'LS90 and divide-by-eight for the 'LS93.
All of these counters have a gated zero reset and the LS90 also has gated set-to-nine inputs for use in BCD nine's complement applications.
To use their maximum count length (decade or four bit binary), the $B$ input is connected to the $Q_{A}$ output. The input
count pulses are applied to input $A$ and the outputs are as described in the appropriate truth table. A symmetrical di-vide-by-ten count can be obtained from the 'LS90 counters by connecting the $Q_{D}$ output to the $A$ input and applying the input count to the $B$ input which gives a divide-by-ten square wave at output $Q_{A}$.

## Features

- Typical power dissipation 45 mW
- Count frequency 42 MHz

Connection Diagrams (Dual-In-Line Packages)

Order Number DM74LS90M or DM74LS90N See NS Package Number M14A or N14A

Order Number DM74LS93M or DM74LS93N See NS Package Number M14A or N14A

Absolute Maximum Ratings (Note)
If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.
Supply Voltage
7V
Input Voltage (Reset) 7V
Input Voltage (A or B) 5.5 V
Operating Free Air Temperature Range DM74LS
$0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$
Storage Temperature Range $\quad-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$

Note: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the "Electrical Characteristics" table are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

## Recommended Operating Conditions

|  |  |  | A |  |  | -2.4 |  |
|  |  |  | B |  |  | $-3.2$ |  |
| los | Short Circuit Output Current | $\mathrm{V}_{\mathrm{CC}}=\mathrm{Max}$ (Note 2) |  | -20 |  | -100 | mA |
| $\mathrm{I}_{\mathrm{CC}}$ | Supply Current | $\mathrm{V}_{\mathrm{CC}}=\mathrm{Max}$ (Note 3) |  |  | 9 | 15 | mA |

tet All typicals are at $\mathrm{V}_{\mathrm{CC}}=5 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$.
Note 2: Not more than one output should be shorted at a time, and the duration should not exceed one second
Note 3: ICC is measured with all outputs open, both RO inputs grounded following momentary connection to 4.5 V and all other inputs grounded.
Note 4: $Q_{A}$ outputs are tested at $l_{O L}=$ Max plus the limit value of $l_{I L}$ for the $B$ input. This permits driving the $B$ input while maintaining full fan-out capability.

## LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
