Maximum ratings are those values beyond which device damage can occur. Maximum ratings applied to the device are individual stress limit values (not normal operating conditions) and are not valid simultaneously. If these limits are exceeded, device functional operation is not implied, damage may occur and reliability may be affected.

- V_{DRM} and V_{RPM} for all types can be applied on a continuous basis. Ratings apply for zero or negative gate voltage; however, positive gate voltage shall not be applied concurrent with negative potential on the anode. Blocking voltages shall not be tested with a constant current source such that the voltage ratings of the devices are exceeded.

THERMAL CHARACTERISTICS

Characteristic	Symbol	Max	Unit
*Thermal Resistance, Junction-to-Case (Note 2)	R _{θJC}	75	°C/W
Thermal Resistance, Junction-to-Ambient	R _{θJA}	200	°C/W
Lead Solder Temperature (Lead Length ≥ 1/16" from case, 10 s Max)	-	+230	°C

- This measurement is made with the case mounted "flat side down" on a heatsink and held in position by means of a metal clamp over the curved surface.
