Filtration & Terminology

- **Filter Element :** The component within the Filter which traps media contamination.
- **Filtration Area :** The actual surface area of the filter element available to trap contamination.
- **Micron :** A unit of measure to describe the mean pore diameter of the filter element or the mean particle diameter of media contamination.
※ One micron = 0.001mm or 0.00004 inch

Element Replacement

- The sintered elements don't permit the contaminants in the gas and liquid to pass through the elements when they are bigger than the pore size of micron.
 - Contaminants are trapped by element pores and it results in pressure buildup.
 - Contamination comes earlier when flow volume is high and media is not clean.
 - The filtering elements need to be replaced for the pressure drop as well as its system purity.
- *Note : Clean filter valve components whenever the element is replaced.

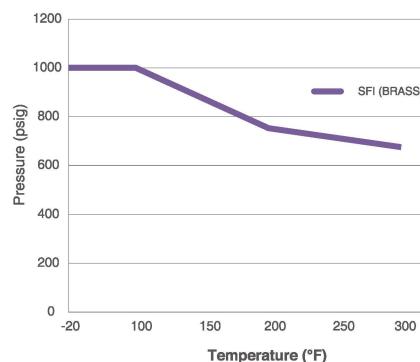

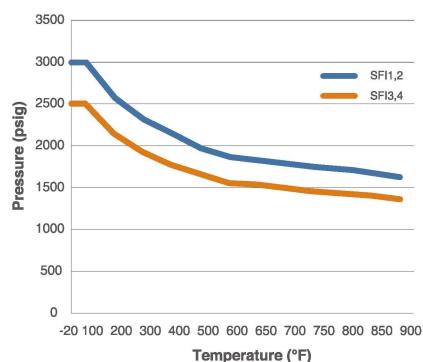

▲ Sintered Elements

- Stainless steel 316 sintered
- High heat resistance and thermal stability up to 1,500°F (815°C).
- High permeability with low-pressure drop.
- Shape-stability with self-supporting structural elements.
- Suitable for compression, vibration, and high impulse pressure.
- Precise filtration due to the exact and uniform pore size and distribution.
- Chemical resistance against acids and caustic solutions in various ranges of pH.
