

Preparation of the substrate for the BAS49 model.

The site for setting up the pool must be chosen with due care. The area must be even, level and hardened, a concrete screed works best.

The total thickness of the concrete screed is at least 10 cm (including at least 5 cm above the ground level, so that the pool does not stand in the water and at least 5 cm in the ground). Metal supports must be concreted in accordance with the following guidelines.

Site preparation should begin with the exact definition of the pool-shaped dimensions plus an allowance of 10 cm for approx. The distance from electricity and water sources should also be taken into account. It is recommended to install the pool in a sunny place.

CONCRETE GRADE NOT LESS THAN C25 / 30, EXPOSURE CLASS XC2.

Product for self- assembly.
