

FLOATING SHELF INSTALLATION GUIDE

Our unique, solid wood shelves are handcrafted from local & sustainable wood varieties.

Our steel floating shelf brackets are fabricated and finished in North Dakota, USA. These innovative brackets hold 150 lbs or more when six 2.5" screws are attached stud direct!

YOU WILL NEED:

- Stud Finder
- Pencil
- Level
- #2 Square Bit
- Included Screws
- Power Drill
- Construction Adhesive

BEFORE YOU BEGIN:

Determine the placement of your floating shelf/shelves and read through this guide in its entirety. If you need help visualizing the placement of your shelf/shelves we recommend marking their lengths out in masking tape on your wall.

Use your stud finder to mark the locations of your studs. Be sure to mark the center of the studs (not the outer edges).

Place your bracket on the wall, aligning it with the stud locations you have marked. Adjust until level.

Hold the bracket firmly in place and drill a pair of screws into each stud location. (You will use a total of 6 screws).

To create a permanent install, insert construction adhesive or silicone into each hole at the back of the shelf.

With even pressure, slide the shelf onto the front of the bracket. Allow the adhesive or silicone 8 hours to dry.

The bracket will create a small gap between the wall and the back of your shelf.
