

# GENERIC TACTILE IMPRESSION DESIGN OVERVIEW

FOR DATACARD® SD460™ CARD PRINTER AND CD800™ WITH INLINE LAMINATION MODULE

The tactile impression feature is a unique, entry-level security feature available exclusively on the Datacard® SD460™ card printer and CD800™ card printer with inline lamination module. Tactile impressions are used to increase the tamper resistance of a card as well as highlight and promote the customer brand, either with our generic designs or with a unique custom design.

## GENERIC TACTILE DESIGNS

Entrust Datacard offers several different generic tactile designs that fit most market applications. These designs showcase a combination of portrait-oriented dies, landscape-oriented dies and dies that can fit either orientation.

Each tactile impression design has a specified orientation — portrait or landscape. Once the die is installed in the tactile impressor module, it cannot be rotated based on card orientation. However, a more symmetrical design can fit both landscape and portrait orientations. Please refer to the Tactile Impression Feature Best Practice Guide for further information on orientation.

## CUSTOM TACTILE DESIGNS

Entrust Datacard also offers the option to create a unique, custom design specific for your ID card program. This tactile impression can contain text, logos, and outlines of images that may vary in design and complexity. Please refer to the Tactile Impression Feature Best Practice Guide for further information on custom die design recommendations and requirements.
