

Duokote thermal blankets

warm pools get used

What is a thermal blanket?

BMH Duokote is a high strength, long lasting pool insulation blanket designed to prevent water heat loss and evaporation. BMH Duokote is fabricated from physically cross linked polyolefin foam sandwiched between two layers of UV stabilised, polyethylene based polyfabric film. The layers are flame bonded together and are extremely resistant to delamination, even at high temperatures. The closed cell foam layer provides excellent insulation and water repellence properties and is resistant to chemical degradation, while the outer woven layers give Duokote its excellent strength and durability. The composite is free of heavy metals, plasticisers and CFCs.

Benefits of a Duokote thermal blanket

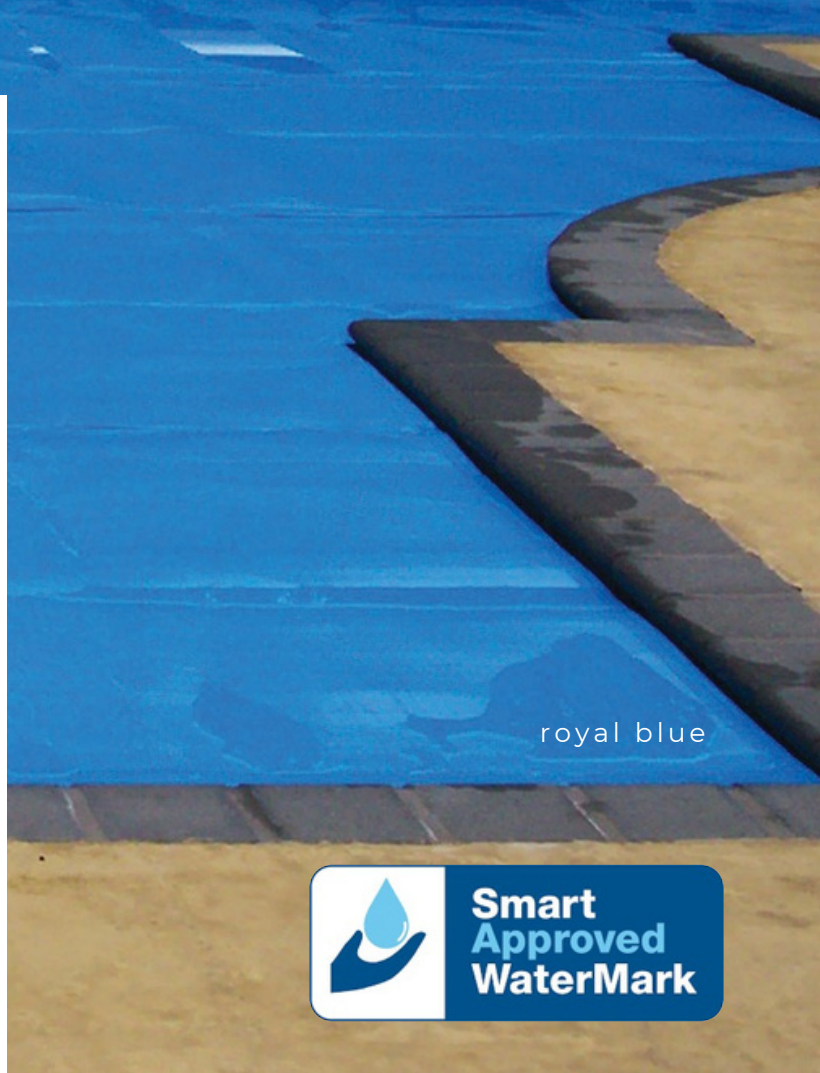

- Heat Retention
- Virtually eliminates evaporation
- Reduces heating costs
- Reduces chemical consumption
- Any shape possible

Superior performance

Duokote has higher thermal insulation properties (R-Values) compared to conventional solar blankets (around 50% higher), resulting in significantly reduced pool heating costs. If you are serious about pool heat you will be paying for heat to be pumped into the pool. Duokotes superior heat retention will ensure more of this expensive heat stays in the pool.

Duokote is tough. The insulating foam core is protected by hard wearing outer layers specifically designed for the pool environment. Durable, tear resistant and with plenty of UV protection these covers are made to last.

Duokote's unique features

- Durable construction
- Closed cell foam laminated between woven P.E. film
- P.E. film is U.V. stabilised
- Suitable for both domestic & commercial situations
- Available in Royal Blue, Sky Blue, Black & Grey
- 36 month warranty
