

Gear Sleeve coupling

- Combination of steel with polyamide ensure good sliding properties
- Important parallel, angular and end-float misalignment of the shafts
- Leads to low maintenance and low wear operation
- Lubrication Free, resistant to all types of lubricants and hydraulic fluids
- Can be used at a temperature range of -20°C to 80°C
- ประกอบด้วยเหล็กและ Polyamide ที่ให้คุณสมบัติเด่นในความลื่นไถล
- สามารถดูแลรักษาและทำความสะอาดได้ดี
- ไม่ต้องการการบำรุงรักษาและการลักหกอตัว ไม่ต้องการการหล่อเย็น
- ทนทานสารเคมีและของเหลว สามารถใช้ในช่วงอุณหภูมิตั้งแต่ -25°C ถึง 80°C

Gear Sleeve Coupling is a series of coupling consisting of two steel, crowned teeth hubs , which are connected with a polyamide internally toothed sleeve . The special new design of the crowned teeth hubs and the lubrication free combination of steel with polyamide ensure good sliding properties and leads to low maintenance and low wear operation, also with important axial, angular and radial misalignment of the shafts. Gear Sleeve Coupling is resistant to all types of lubricants and hydraulic fluids and can be used at a temperature range of -25°C — +80°C.

Diagramma di velocità
Speed diagram

For a correct selection of the Gear Sleeve coupling, the nominal torque must be derated by the fs service factor. The maximum starting torque must not exceed the maximum torque of the coupling. With constant torque and well aligned shafts, Gear Sleeve Coupling can be used up to the maximum torque. The maximum misalignment and the maximum speed cannot co-exist at the same time; therefore the presence of misalignment reduces the possibility of maximum speed, as indicated in the table.
