

ALCOLIN PROFESSIONAL

Description

ALCOLIN PROFESSIONAL is the industry standard for woodworking and is the choice adhesive for the Professional and DIY enthusiast. It is a new technology advanced aliphatic resin adhesive, specially developed for woodworking, offering many advantages over conventional PVAc adhesives such as superior creep resistance, heat resistance, solvent resistance, and wet tack. ALCOLIN PROFESSIONAL is commonly referred to as 'carpenters' or 'yellow' glue. ALCOLIN PROFESSIONAL has a VOC of 2.4g/L, meeting the Green Building Council of South Africa 'African Green Star SA Office V1' specification of less than 30g/L

Features & Benefits

- High creep resistance - excellent for stress joints such as those found in tables and chairs
- Strong initial tack - holds small parts without the need for clamping
- Tough glue line - excellent sandability
- Superior strength - final bond stronger than wood
- Excellent heat resistance - use in areas subject to heat, ideal for manufacture of post form tops
- Fast setting - reduced clamp time, increasing turnaround time
- Chemical resistant - unaffected by most finishes
- Versatile - bonds a variety of wood species and processed board composites
- Low VOC - non-toxic, non-flammable (wet state) – 2.4g VOC/L
- Water-based formulation - cleans up easily with water

Applications

- Ideal for stress joints such as those found in tables and chairs
- Wood turning, model building, restoration of antique furniture
- Suitable for edge gluing, face gluing, laminating, finger jointing, doweling, veneering and paper foiling applications

Adhesion

Excellent adhesion to soft woods (Pine, Meranti), medium woods (Beech, Oak), hard woods (imbuia, teak) and processed boards composites (hardboard, chipboard, supawood, high pressure laminates), leather, cloth, felt, paper, cardboard, cork and most other porous materials

Performance properties – industry standards

Meets the requirements of SANS 10183:2009 D1 standard

Limitations

ALCOLIN PROFESSIONAL is not intended for exterior use or where moisture is likely. For exterior applications uses ALCOLIN ULTRA WOOD GLUE OR ALCOLIN WATERPROOF GLUE. Should not be used to adhere coated woods, synthetic woods and melamine. Not suitable for structural or load bearing applications, or where gap filling properties are required. Do not use when temperature, glue or materials are below 10°C. Because of variances in the surfaces of treated lumber, it is a good idea to test for adhesion

Safety instructions

Although ALCOLIN PROFESSIONAL is non-toxic, safe handling practices should be implemented to avoid irritating sensitive skin. It is advisable to wear gloves in order to avoid direct skin contact. If glue comes in contact with skin or eyes, flush thoroughly and immediately with water. If irritation continues, seek medical attention. Glue is slippery when wet, so care should be taken when cleaning spillages that occur. Refer to our Material Safety Data Sheets for further toxicological information and comprehensive handling instructions

Surface preparation

The surface must be clean, dry, free from all loose materials, dust, dirt, rust and any other contaminants. When working with woods that are oily or high in tannic acid, wipe the joints with acetone before gluing. Acetone clears the contaminants from the wood pores on the bonding surface and dries quickly without leaving any residue

For the best result, planing of the wood should take place within 24 hours of gluing. After this time, the cell structure of the wood closes, which may significantly reduce the ability of the glue to penetrate sufficiently, resulting in a poor bond

The moisture content of the wood should be between 8 – 12%. Higher moisture contents will result in longer pressing times and will lead to risk of delamination and wood splitting due to shrinkage of the wood on either side of the bond-line

To avoid wood shrinkage or swelling after processing, it is very important to ensure that the wood is dried to a moisture content corresponding to the equilibrium moisture content (EMC) at the site where the article will be used. EMC is the moisture content of the wood that corresponds to a given relative humidity. If the moisture content of the wood is higher than EMC, it will lose moisture until it reaches EMC. A corresponding shrinkage in the wood will occur which may result in delamination along the glue line and/or wood splitting. *Consult with your Alcolin Rep for further information*

To prevent “stepped joints”, it is important to ensure that all the wood has similar moisture content. This can be achieved by allowing the wood to acclimatize in your shop for 7 – 14 days

Care should be taken to ensure a tight fit between wood pieces with no saw marks and no burnishing of the surfaces to be glued

Poor surface preparation may result in the delamination of the glued joint

Instructions for use

- Ensure that surfaces are prepared as above and ensure that all joints fit tightly
- ALCOLIN PROFESSIONAL is suitable for high frequency presses, hot presses and cold presses
- For a successful gluing operation, consideration must be given to the following points discussed in detail below: Glue spread rate, Assembly time, Press time, temperature and pressure, & Post press conditioning
- Apply glue with a roller, wheel, toothed trowel or brush. Apply a **Spread Rate** of approximately 200g/m² (glue “squeeze out” should be seen coming from the joint). The glue spread rate is dependent on the object of gluing and the wood species, and must be determined in each specific case. When gluing hard and oily wood species, the substrates should be newly planed and the adhesive should be spread on both surfaces. Foiling and Veneering applications will require a lower spread rate of approximately 60 g/m² and 100g/m² respectively

- The **assembly time** refers to the time lapse between glue spreading and application of pressure and is generally accepted to be approx. 15 minutes. The time between glue spreading and closing the assembly is **open assembly time**, which in the case of ALCOLIN PROFESSIONAL is approx. 5 minutes at 21°C and 50% relative humidity. The time between closing the assembly and pressure application is called the **closed assembly time**, which is approx. 10 minutes. It is recommended that only the amount of adhesive that can be used within this period be applied at any one time. The assembly time is influenced by the glue spread rate, environmental conditions, and wood species. Assembly time is increased by cold weather, high humidity; high spread rate and high-density wood species (slow absorption of the adhesive into the wood)
- **Press time** is dependent on wood species, moisture content and environmental conditions. Cold temperatures and higher humidity levels may require longer press times. Denser wood species, oily woods and those with higher moisture content will also require longer press times. We recommend pressing an unstressed joint for 30 to 60 minutes. Stressed joints such as bent laminations, need to be pressed for 24 hours
- Appropriate **Press Pressure** is essential for a successful bond. Sufficient pressure is required to bring the joint tightly together. Too high pressure and short assembly times may cause the glue to be squeezed out of the glue line, resulting in glue starvation and delamination. Too little pressure will not bring the surfaces together closely enough to form a strong bond along the glue line. 7 - 10 bar or kg/cm² (100-150 psi) is recommended for soft woods, 9 -12 bar or kg/cm² (125-175 psi) for medium woods and 12 -17 bar or kg/cm² (175-250 psi) for hard woods. Clamps should be positioned a minimum of 4cm away from the sides, and evenly spaced at 20-30cm throughout the piece
- Temperature in the glue line can be between 10 - 90°C. Use of the adhesive below 10°C will result in ‘chalking’ and subsequent delamination. Higher temperatures up to 110°C can be used if the press times are kept very short. For **Press Temperatures** above 50°C, it is recommended that the shortest possible press time be determined
- Glue joint “squeeze out” may make the area around the joint difficult to stain. Although sanding the area will help, we recommend using masking tape to cover the areas that you do not want exposed to glue. Remove excess glue immediately by wiping with a clean damp cloth
- ALCOLIN PROFESSIONAL does not discolour wood, however, iron which might come from the glue spreader, rusted cutter blades, or from tannic acids in some wood species, e.g. oak, may contaminate the glue and darken the glue line. For this reason, always use clean, sharp, and unrusted cutter blades for cutting the wood and avoid using metal tools with the adhesive
- **Post Press Conditioning** : after a minimum clamping period, the panel will develop enough handling strength to permit it to be removed from the press. An overnight cure is recommended prior to machining. A storage period of 3-4 days may be required to eliminate sunken joints caused by residual moisture in the glue line

Cleaning

- Machines and tools can be cleaned with water

Storage stability

ALCOLIN PROFESSIONAL has a shelf life of at least 12 months if stored in a cool (below 25°C), dry place in it’s original moisture-tight container. The glue should not be stored below 0°C or above 30°C. If the material is kept beyond the recommended shelf life, it is not necessarily unusable. A check should be performed to observe whether the product has not separated, thickened, or shows signs of bacterial degradation (bad smell, discoloration and low viscosity). To maximize the shelf life of the opened container, ensure that the packaging is closed to create an airtight environment when not in use. If the packaging is left open for long periods, the glue will thicken and form a skin on the surface, which can damage pumps and block filters

Product packaging

- 125ml bottle
- 250ml bottle

TECHNICAL DATA SHEET

Product data

Physical data

Type	Aliphatic resin emulsion
Appearance	Viscous yellow liquid, drying to a tough yellow glue line
Density	Approximately 1.10g/cm ³
MFFT	Approximately 10°C
PH	Approximately 4.5
Solids	Approximately 45%
Viscosity	Approximately 7000cps (#5, 20rpm, 23°C)

Application data*

Minimum application temperature	10°C
Spread rate	Approximately 200 – 250g/m ² for assembly Approximately 150 - 200g/m ² for laminating Approximately 100 - 150g/m ² for veneering Approximately 60 - 90g/m ² for foiling
Assembly time (21°C at 50% RH)	5 minutes (Open) 10 minutes (Closed)
Press time (21°C at 50% RH)	Unstressed Joints : 30 to 60 minutes
Press temperature	Room Temperature to 110°C
Press pressure	Soft Woods : 7 – 10 Bar Medium Woods : 9 – 12 Bar Hard Woods : 12 – 17 Bar

**Please refer to "Instructions for Use" section for further details*

Performance data

Glue line	Meets SANS 10183:2009 D1 standard
Tensile strength (wood failure)	7.3N/mm ² (100%) – beech wood, 2hrs clamping; 22hrs condition 2.5N/mm ² (77%) – hard maple
Heat resistance @ 90°C	6.8N/mm ² (40%) – beech wood, 2hrs clamping; 48hrs condition
Service temperature range	-5°C to + 90°C

The above information is only offered, as a guide to the use of this product. Furthermore, users should satisfy themselves that it is suitable for their needs. Since we have no control over the conditions under which it is used, we cannot accept responsibility for problems caused by the use and/or application of this product.
