Welcome to the sixthreezero experience. Now for the fun part... the assembly.

I know, I know, we’ve all had to assemble something we’ve bought before - a tv stand, coffee table, possibly a grill or even a bike a time or two before. It’s never fun, it never goes well, you always lose a nut or a screw and by the time you’re done, you’d rather destroy whatever it is you’ve bought than actually use it. Well, I’m here to make sure that doesn’t happen.

Assembly of a bike can be a fun, engaging, learning experience. Call up a friend, ask your spouse or child, don’t rush, and enjoy the process. Part of the fun in building your bike is telling people “I built it all by myself.” I build bikes almost everyday and I always learn something new. I enjoy the process of building something from the ground up, and I hope you will too.

The instructions were written and designed by me, so if you have any suggestions please let me know!

Good luck,

Jacob

MECHANIC / SIXTHREEZERO
Creating something wonderful with your own hands is basically the best feeling ever. We want you to have fun building your new bike, so there’s only a few things you need to get started.
SCISSORS
(use to cut zip ties)

8, 10, 13, AND 15MM CRESCENT WRENCHES
or use the multi-tool provided

4, 5, AND 6MM ALLEN KEY

PHILLIPS HEAD SCREWDRIVER

SCHRADER VALVE BICYCLE PUMP

BICYCLE OR AUTO GREASE recommended
Lay out all the parts in front of you. Make sure you have all the parts before getting started.

**WHAT'S IN EACH BOX?**

- FRONT FENDER BOLT 10MM
- FRONT BOLT 12MM
- PEDALS + REAR AXEL 15MM
- PEDALS + REAR EYELET BOLTS 8MM
- 13MM
- 14MM
- 15MM
- 16MM
- 17MM
- 18MM
- 19MM
- 20MM
- 21MM
**HANDLE BAR / FRAME / REAR WHEEL AND REAR RACK SET-UP**
Seat post is zip-tied to frame

**QUICK RELEASE FRONT WHEEL**

**FRONT REFLECTOR**
pre-installed
ASSEMBLY GUIDE
4, 5, AND 6MM ALLEN KEYS

EXPERIENCE BOOKLET

ASSEMBLY GUIDE

MULTI-TOOL

4, 5, AND 6MM ALLEN KEYS
PEDALS

QUICK RELEASE SKEWER

HARDWARE

SEAT ATTACHED TO SEAT TUBE

BOX 3

BOX 4
All the names of all the parts for your bike, all in one place. Keep this handy during assembly, and everything will go just fine.
FRONT WHEEL + REAR RACK

Tools you'll need:

- 4MM + 5MM ALLEN KEY
- (4) 4MM ALLEN KEY SCREWS (pre-installed)

Parts required:

- QUICK RELEASE FRONT WHEEL
- FRAME, REAR RACK + REAR WHEEL
- QUICK RELEASE SKEWER

HAVING TROUBLE? WANT LIVE HELP? CALL 310.982.2877 OR EMAIL INFO@SIXTHREEZERO.COM.
01

Spin the front fork so that the brakes are pointing forward.

**CORRECT**
The front brake is facing away from the bike body.

**INCORRECT**
The brakes are behind the fork.

02

Pinch front brake arms, pulling the metal tubing up and out until it is disengaged and the brake arms are open.
Locate the arrow on the wall of the tire and position the tire like the image below. With the arrow pointing forward, insert the wheel into the fork dropouts. The axle nuts will fall inside the fork entry.

**CAUTION**
DO NOT untighten axle nuts on the front wheel.

Use a 5mm allen key to loosen the front brake pads and rotate them horizontally. Retighten them.

Reattach the brake arms by connecting the metal tube as shown.
All of the components for the quick release skewer are attached out of the box.

Unscrew QR5 and remove QR4. Do not remove QR2 and QR3 from the quick release handle QR1.

NOTE
Quick release skewer must be installed correctly to avoid bicycle damage and/or injuries.

Insert the quick release skewer through the hub opening on either side of the wheel, as shown below.

Slide quick release skewer completely through the hub.
07

Place QR4 on the open side of the quick skewer, with the smaller end pointing inward.

08

Making sure the wheel is straight, attach QR5 to QR1 by compressing the spring completely. Hold the quick release lever in place and tighten QR5 lightly.
Lift the lever up towards the fork. If the lever does not lock in place smoothly, loosen QR5 slightly and try again. It will take a small amount of strength, but that is normal.

NOTE
The lever should be tight enough to feel resistance at a 90° angle. Make sure the front wheel is secure tightened and properly aligned so there are no issues when you assemble the brakes.

Once the front wheel is secured, lower the kickstand.
Align the front rear rack arms to the eyelets on the frame below the seat. Use a 4mm allen key to tighten the screws and attach the rear rack to the frame.

Install the bottom rear rack arms to the frame using the 4mm allen screws. Tighten with a 5mm allen key. Repeat on both sides.
**HANDLEBAR, SEAT + PEDALS**

**BICYCLE PUMP**

Insert the handlebar stem through the lock nut cap and into the headtube. Line up the stem, frame, and front wheel, then tighten the handlebar stem bolt.

**NOTE**
Straightening the stem, frame, and front wheel will ensure that your handlebars and wheel are properly aligned.

Line up the stem, frame, and front wheel, then tighten the handlebar stem bolt.

Loosen handlebar adjustment bolt using the 6mm Allen key.
Loosen handlebar adjustment bolts using the 6mm Allen key.

Place handlebar between the stem and faceplate, then insert and tighten the allen key bolts with a 6mm Allen key. Tighten to an appropriate tension until the handlebar has no free play (Wiggle or Move).
Our suspension seat post absorbs bumps while travel. There is no adjustment required. Due to the suspension on the seatpost, the seat will be raised an inch above the seatpost clamp and that is normal.

Apply great to seat lever, then open seat post clamp. Holding the seat post firmly, insert into seat post tube until the top is level with your waist.

Close the seat post clamp lever.

Straighten the reflector so that it points forward.

Adjust the position of the front reflector by loosening the screw on the bracket.
Apply grease to threading on both pedals.

Select the pedal stamped R and locate the right side of the bike (with the chain and chain guard). Align threading with the right crank arm, turning the pedal clockwise to tighten it.

Locate the pedal stamped L and align with the left crank arm. The left side pedal is reverse-threaded, tightening in a counterclockwise direction.

Hand tighten accordingly, then follow up by tightening both pedals with the 15mm multi-tool or crescent wrench.
21

BICYCLE PUMP

Pump air into the tires to **PSI 40-65 MAX**, as recommended on the sidewall of the tire.

22

 Sit on the bike and check the angle formed by your knee.

If your knee forms the incorrect angle, use the seat post clamp lever to raise the seat until you have a subtle bend or achieve a comfortable height.

**CORRECT**

**INCORRECT**
BRAKE ASSEMBLY

Only follow steps 1-9 if your brake cable is not attached to the bicycle.

If your brake cable is attached, skip to step 10.

There are two ends to the brake cable.

One end has a barrel attached, while the other end has an open piece of cable.
02 Attach the brake cable to the brake lever by squeezing the lever and inserting the barrel into the barrel hanger.

03 Pull on the cable and slide it through the narrow crevice that runs along the brake lever.

04 Slide the cable housing up toward the brake lever until it fits snug inside the barrel adjuster.

05 Turn the lock ring on the barrel adjuster clockwise, tightening the barrel to prevent any loose movement.
06

Insert the open end of the brake cable into the larger end of the metal tube.

07

Slide the metal tube up the brake cable until the housing fits snugly into the cable housing.
08

Slide the exposed end of the metal into the metal tube hanger, located on the left brake arm. Make sure the metal tube is hooked securely inside the hanger.

09

Using a 5mm Allen key, loosen the brake cable adjustment screw. Slide remaining brake cable between the right brake arm and the adjustment screw.
10

Pull the cable outward, reducing the distance between the brake pads and the rim by about 1/4 inch on both sides. Retighten the adjustment screw.

11

Make sure the pads are evenly lined up with the rim. If the pads rub against the tire, they are too high; if they don’t make full contact with the rim when braking, they are too low.

Adjust the positions by holding the brake pad with one hand and loosening the nut on the back with a 5mm Allen key.
If one pad seems to run against the rim while the other still has plenty of space, you will need to center the brakes. To do this, adjust the spring tensioner screws located at the base of each brake arm.

Tightening the screw on the right brake arm pushes the right brake pad away from the rim, and the left brake pad towards the rim.

Loosening the right screw allows the right brake pad to move closer to the rim, and the left brake pad away from the rim.
7 SPEED DERAILLEUR TUNING

**Tools Required**
- Phillips Screwdriver
- 9mm Multi-Tool

Having trouble? Want live help? Call 310.982.2877 or email info@sixthreezero.com.
01
To adjust the rear derailleur, first twist the shifter until the number 7 is highlighted on the shift knob.

02
Rotate pedals until the chain falls into the smallest cog.

WATCH ASSEMBLY VIDEOS ON OUR YOUTUBE CHANNEL, HTTPS://SIXTHREEZERO.COM/PAGES/ASSEMBLY
03

Turn the barrel adjuster located on the rear derailleur clockwise until it stops.

04

If the chain still hasn’t reached the smallest cog, then you will need to adjust the “High Gear” limiting screw located on the derailleur (indicated by the letter H).

With a Phillips screwdriver, gradually turn the screw counterclockwise 1/4 turn at a time while rotating the pedal until the chain falls onto the smallest cog.

NOTE

The “High Gear” limiting screws are very sensitive. We recommend using only 1/4 turn at a time, in case you have to revert back to it’s original position.
05

Now adjust the cable tension, which controls how your bike will shift. Using a 9mm crescent wrench or the multi-tool, loosen the cable adjustment screw and pull on the cable. While keeping tension on the cable, tighten the cable adjustment screw.

06

Rotate the pedals and try to shift between gears. If it doesn’t shift from 7th to 6th gear in one click, then the cable needs to be tightened. To tighten the cable, twist the barrel adjuster counterclockwise 1/4 turn at a time until it is able to shift from 7th to 6th gear in one click.

Shift through the gears from 7th to 1st, then back from 1st to 7th. If the gears feel sluggish when shifting from 7th to 1st, tighten the cable by turning the barrel adjuster counterclockwise. If shifting feels fine from 7th to 1st, but sluggish from 1st to 7th, loosen the cable by turning the barrel adjuster clockwise.

Continue to adjust the derailleur cable until you are able to shift between each gear with a single click.

NOTE

Each gear should shift with a corresponding ‘click’ sound.
Your bike is equipped with front fork spring suspension.

The position of blue lever indicates whether the front fork is locked or unlocked.

The front fork is locked if the blue lever is highlighting the color red. If the blue lever is highlighting the color green, the front fork is unlocked allowing for damped and cushioned ride.
There is no need to adjust the tension of the spring right out of the box. If you do decide to add or relieve tension, note the amount of twist and/or rotations in any given direction it took to get to your preferred riding stiffness or softness.
Your bike should be ready to ride at this point. Time to enjoy the ride! If you have/had any trouble at all, please feel free to contact our team at:
