ASSEMBLY GUIDE

RIDE IN THE PARK - 3 & 7 SPEEDS
Our Commitment

We want you to love your bike as much as we do. If you run into any issues, no matter how small, let us know and we’ll take care of it.

Welcome to the sixthreezero experience. Now for the fun part... the assembly.

I know, I know, we've all had to assemble something we've bought before - a tv stand, coffee table, possibly a grill or even a bike a time or two before. It's never fun, it never goes well, you always lose a nut or a screw and by the time you're done, you'd rather destroy whatever it is you've bought than actually use it. Well, I'm here to make sure that doesn't happen.

Assembly of a bike can be a fun, engaging, learning experience. Call up a friend, ask your spouse or child, don't rush, and enjoy the process. Part of the fun in building your bike is telling people “I built it all by myself.” I build bikes almost everyday and I always learn something new. I enjoy the process of building something from the ground up, and I hope you will too.

The instructions were written and designed by me, so if you have any suggestions please let me know!

Good luck,

MECHANIC / SIXTHREEZERO
Creating something wonderful with your own hands is basically the best feeling ever. We want you to have fun building your new bike, so there’s only a few things you need to get started.
SCISSORS  
(use to cut zip ties)

15MM CRESCENT WRENCH  
or use the multi-tool provided

5 AND 6MM ALLEN KEY  
(4MM NOT INCLUDED)

PHILLIPS HEAD SCREWDRIVER

SCHRADER VALVE BICYCLE PUMP

2 PENNIES
WHAT’S IN THE BOX?

Lay out all the parts in front of you. Make sure you have all the parts before getting started.

WHAT’S INSIDE:
- 12MM
- 14MM
- 17MM
- 10MM
- 8MM
- 13MM
- 15MM
- 13MM
- 8MM
- PEDALS + REAR AXEL 15MM
- 9MM
- 17MM
HANDLEBAR / FRAME / REAR WHEEL AND REAR RACK SET-UP
seat post is zip-tied to frame

QUICK RELEASE FRONT WHEEL

FRONT AND REAR REFLECTORS
If the hardware is not in the box, it will be pre-installed on seat stays and fork.

**NOTE**

PEDALS

QUICK RELEASE SKEWER

SEAT attached to seat tube
BIKE PARTS
REFERENCE GUIDE

All the names of all the parts for your bike, all in one place. Keep this handy during assembly, and everything will go just fine.
FRONT WHEEL + REAR RACK

Parts required:

- QUICK RELEASE FRONT WHEEL
- FRAME, REAR RACK + REAR WHEEL
- QUICK RELEASE SKEWER
- (4) 4MM ALLEN KEY SCREWS PRE-INSTALLED ON SEAT STAYS

Tools you'll need:

- (4) 4MM ALLEN KEY SCREWS
- NOT INCLUDED
- 10MM ALLEN WRENCH STEP 6

WE STRIVE FOR PERFECT, ALTHOUGH IT’S NOT ALWAYS POSSIBLE, WE NEVER LEAVE A RIDER BEHIND.
Spin the front fork so that the brakes are pointing forward. Turn the handlebars to match the Correct Image so that the cables don’t loop around the headtube.

**INCORRECT**
The brakes are behind the fork.

**CORRECT**
The front brake is facing away from the bike body.

Locate the quick release skewer in the small box. All of the components for the quick release skewer are attached.

Remove the adjustment nut (QR5) and spring #2 (QR4) from the rod (QR3).

**NOTE**
Quick release skewer must be installed correctly to avoid bicycle damage and/or injuries.
Fully insert the Rod (QR3) into the hollow axle of the wheel.

Slide quick release skewer completely through the hub.

After Step 3, no tools are required to install the front wheel. If the brakes are too tight that it won’t allow the front wheel to insert completely into the fork, reference Step 6.
Place spring #2 (QR4) back onto the end of the rod (QR3), with the smaller end of the spring pointing inward. Loosely reinstall the nut (QR5) onto the rod (QR3).

Insert the wheel into the fork dropouts. If the brakes do not allow the wheel to pass, please see Step 06.
If the brakes are too tight to let the wheel pass, use a 10mm wrench to loosen and disengage the brake cable from the brake arm. We will reattach the brake cable in the Brake Assembly section.

Hold the lever (QR1) in the ‘Open’ position with one hand while tightening the nut with the other hand. Tighten until slightly snug but not tight.
Once the front wheel is secured and centered, lower the kickstand and locate your rear rack.

**NOTE**

The lever at a 90° angle, should be tight enough to feel resistance when you close the lever. Make sure the front wheel is securely tightened and properly aligned so there are no issues when you assemble the brakes.
Let’s attach the rear rack. If the screws are pre-installed, unscrew them from the frame. Align the front arms of the rear rack to the eyelets on the frame below the seat. Use a 4mm allen key to tighten the screws and attach the rear rack arms to the frame. Repeat on both sides.

Install the bottom rear rack arms to the frame using the 4mm allen screws. Tighten with a 4mm allen key. Repeat on both sides.
HANDLEBAR, SEAT + PEDALS

HANDLEBAR
PEDALS
SEAT
PHILLIPS SCREWDRIVER
BICYCLE PUMP
6MM ALLEN KEY
13MM + 15MM MULTI-TOOL

HAVING TROUBLE? CALL 310.982.2877 OR EMAIL THETEAM@SIXTHREEZERO.COM
Insert stem into the lock nut.

Line up the stem, frame, and front wheel, then tighten the handlebar stem bolt using a 6mm Allen key.

**NOTE**

Straightening the stem, frame, and front wheel will ensure that your handlebars and wheel are properly aligned.
Loosen handlebar adjustment bolt using the 6mm Allen key to change the angle of the handlebars to your liking. Riders typically prefer their grips parallel to the ground.

Locate your front reflector. Rotate the reflector so that it points forward.

Adjust the position of the front reflector and tighten the screw on the bracket with a Phillips Screwdriver.
Open seat post clamp. Holding the seat post firmly, insert into seat post tube until the top is level with your waist.

Close the seat post clamp lever.

CAUTION
Make sure not to drop seat post into the frame.

Tighten and close the seat post clamp lever. We will adjust the seat position in a later step.
Select the pedal stamped R and locate the right side of the bike (with the chain and chain guard). Align threading with the right crank arm, turning the pedal clockwise to tighten it.

Locate the pedal stamped L and align with the left crank arm. The left side pedal is reverse-threaded, tightening in a counterclockwise direction. Instead of lefty loosey, it is lefty tighty.

Hand tighten accordingly, then follow up by tightening both pedals with the 15mm multi-tool or crescent wrench.
Pump air into the tires to 40-65 PSI as recommended on the sidewall of the tire.

Sit on the bike and check the angle formed by your knee. If your knee forms the incorrect angle, use the seat post clamp lever to raise the seat until you have a subtle bend or achieve a comfortable height.

**CORRECT**

**INCORRECT**

The images above use a different bicycle, but the instructions are the same.
NOTE
Sometimes the front brake cable is disconnected from the handlebar lever for shipping.

If your brake cable is not connected to the handlebar lever, please see steps 1-4.

ATTACHED BRAKE CABLE

There are two ends to the brake cable.

One end has a barrel attached, while the other end has a cable cap attached to the end of the cable.
02 Attach the brake cable to the brake lever by squeezing the lever and inserting the round cable end into the linkage.

03 Slide the cable through the slotted opening in the brake lever. Insert the end cap of the cable housing into the brake lever.

04 Slide the cable housing down toward the brake lever until it fits snug inside the barrel adjuster.
If brakes are too loose, turn the barrel adjuster counterclockwise to increase cable tension. If brakes are too tight, you can loosen the cable at the bolt or make micro-adjustments by turning the barrel adjuster clockwise to relieve cable tension. Use the 10mm lock nut to lock your adjustment in place.

Pinch the brake arms together till they are touching the rim. Simultaneously, pull the cable downward as tight as you can and retighten the cable bolt with a 10mm wrench or socket. When you release the brakes, they will likely pull more slack out of the cable and pull away from the rim. Spin the wheel to see if there is clearance between the rim and brake pads. You may need to tighten or loosen the brakes. Please see next step.
Make sure the pads are evenly lined up with the rim. If the pads rub against the tire, they are too high; if they don’t make full contact with the rim when braking, they are too low.

Adjust the positions by holding the brake pad with one hand and loosening the nut on the back with a 10mm Allen key.

**FENDERS**

Locate the front fender. The strut will be attached to the fender.

Two 4mm Allen key screws will be attached to the fork eyelets.
Use a 10mm Allen wrench to remove the pivot nut behind the fork. We will be installing and centering the brakes at the same time.

Once the pivot nut is removed, you will notice a curved washer. Leave that in place and insert the fender underneath the fork and slide the fender tab into the centering bolt as shown in the image below. Careful to not pull and detach the entire braking system.
Before you tighten the brakes, pinch both brake arms against the rim. Use a 10mm Allen wrench to retighten the pivot bolt. By doing that, you have centered the brakes.

Use a 4mm Allen key to attach the strut to the fork eyelets. Repeat on both sides.
WE STRIVE FOR PERFECT, ALTHOUGH IT’S NOT ALWAYS POSSIBLE, WE NEVER LEAVE A RIDER BEHIND.

3 SPEED TUNING

DIAGRAM

TOOLS REQUIRED

PHILLIPS SCREWDRIVER

10MM MULTI-TOOL

LOCK NUT

BARREL CABLE ADJUSTER

CABLE

SHIFTER
01
Check and adjust gears. Shift into 2nd gear by twisting the shifting unit. The shifter has an outer exterior that resembles a golf ball, that is the part that turns.

02
Look through the window in the back of the rear hub. If the yellow dot is within the parallel lines and arrows, your bike is properly adjusted. Please note that the yellow dot is only an approximate indicator. It is okay to move the dot outside of the lines if needed to obtain the best adjustment.
03

If not adjusted correctly, loosen the lock nut with a 10mm crescent wrench, and turn the adjustment barrel in either direction. The yellow dot will start to move.

04

Tightening the adjustment barrel in, moves the yellow dot away from the rear wheel. This decreases cable tension and helps to shift down into lower gears.
Untightening the adjustment barrel out moves the yellow dot in towards the rear wheel. This increases tension on the cable and helps to shift up into higher gears.

Center the yellow dot within the parallel lines. Once the yellow dot is within range, tighten down the nut using the 10mm crescent wrench.
WE STRIVE FOR PERFECT, ALTHOUGH IT’S NOT ALWAYS POSSIBLE, WE NEVER LEAVE A RIDER BEHIND.
To adjust the rear derailleur, first twist the shifter until the number 7 is highlighted on the shift knob.

Rotate pedals until the chain falls into the smallest gear. Sometimes, the chain will not go all the way to the smallest gear at this point. This is okay. Please proceed to the next step.
03

Turn the barrel adjuster located on the rear derailleur clockwise until it stops. At this point, detach the cable from the derailleur by loosening the Cable Clamp Bolt. We will leave the cable detached from the derailleur until we reattach it in Step 05.

04

If the chain still hasn’t reached the smallest cog, then you will need to adjust the “High Gear” limiting screw located on the derailleur (indicated by the letter H).

With a Phillips screwdriver, gradually turn the screw counterclockwise 1/4 turn at a time while rotating the pedal until the chain falls onto the smallest cog.

NOTE

The “High Gear” limiting screws are very sensitive. We recommend using only 1/4 turn at a time, in case you have to revert back to its original position.
Once the chain falls all the way into 7th gear, reattach the cable. Use a 9mm wrench to tighten the Cable Clamp Bolt to secure the cable to the derailleur.

Rotate the pedals and try to shift between gears. If it doesn’t shift from 7th to 6th gear in one click, then the cable needs to be tensioned. To tension the cable, twist the barrel adjuster counterclockwise 1/4 turn at a time until it is able to shift from 7th to 6th gear in one click.

Shift through the gears from 7th to 1st, then back from 1st to 7th. If the gears feel sluggish when shifting from 7th to 1st, tighten the cable by turning the barrel adjuster counterclockwise. If shifting feels fine from 7th to 1st, but sluggish from 1st to 7th, loosen the cable by turning the barrel adjuster clockwise.

Continue to adjust the derailleur cable until you are able to shift between each gear with a single click.
Tell us about your assembly experience. If you have/had any trouble at all or didn't, and would like to leave feedback and help us improve our assembly instructions you can.

We strive for perfect, although it’s not always possible, we never leave a rider behind.
Most Sixthreezero bicycles have their serial number stamped into the bottom of the frame below the bottom bracket. You'll need to lift it up to see underneath, or use a smart phone to take a photo (with the flash) of the underside. The serial number is located on the frame behind the chainring. Contact us if you're having trouble finding the serial number.
CONGRATULATIONS

You did it! Time to take your brand new bike for a spin.
Still have questions? We’re happy to help.
Want to share your journey with us? We’re happy about that, too.
