

Wireless **CarPlay**
integration for
TESLA

ITZ-TSL

- USB-Connected wireless CarPlay integration for Tesla

Contents

ITZ-TSL Interface

USB-C to C Cable

USB-A to C Cable

Overview

- 1 - USB (updates)
- 2 - USB-C (connection to vehicle)

- **PHONE Icon**: Indicates unit has phone connection
- **4G Icon**: Indicates the unit has data connection
- **Bluetooth Icon**: NOT USED
- **BOLT Icon (lower)**: Indicates unit is powered properly

Installation

Installation is as simple as connecting the provided USB C cable to the unit, then connecting the other end to any USB port in the car (power only is required).

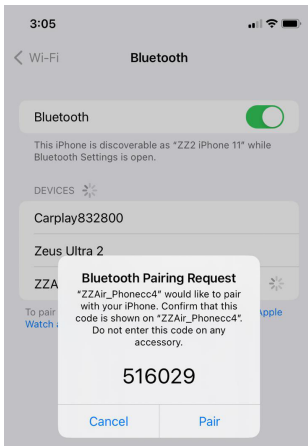

Operation & Functionality

This device automatically dictates and connects to a hot-spot (from your phone), which the OE Tesla (Internet browser) system must connect to for CarPlay to display on screen. The system must be connected to this hotspot upon every drive - when connecting to the unit initially, be sure to choose **'Stay connected while driving'** (from the Tesla connection) *You will not have to physically create a hot-spot every time you enter the car. Only keep on your Bluetooth and WIFI and connect CarPlay normally (via Bluetooth).*

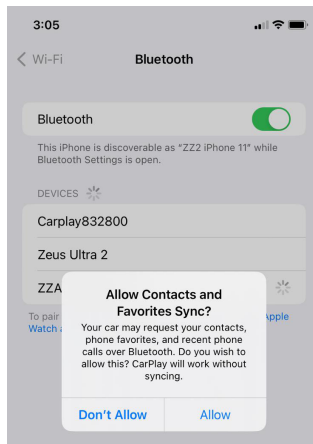

Audio for music and phone calls is handled via the OE Tesla Bluetooth system. The CarPlay interface will stay active during these times.

1. Connect the unit the USB-C cable, and connect the other end of the cable to the USB port from the car to supply power.

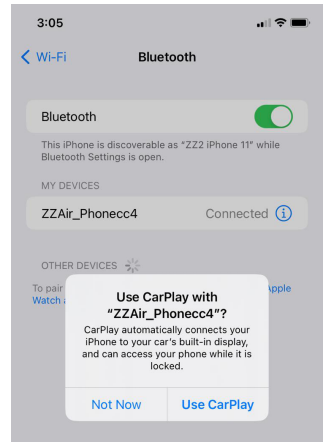

On the iPhone, Go to Settings, then Bluetooth. Choose 'ZZAir_Phonexxx'. Pair to it when prompted.

Press 'Allow' when it asks to sync Contacts and Favorites.

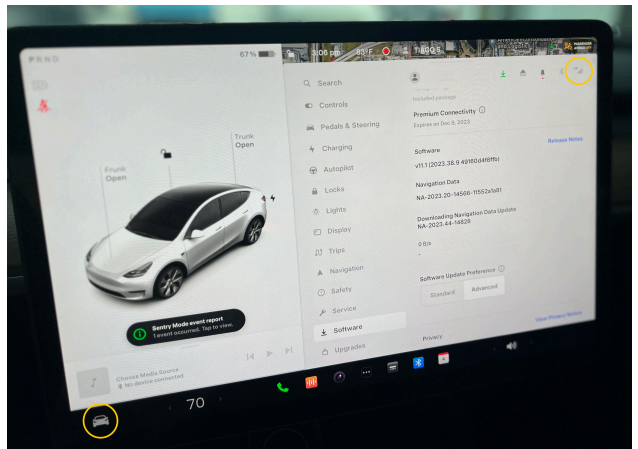

Choose 'Use CarPlay' when prompted.

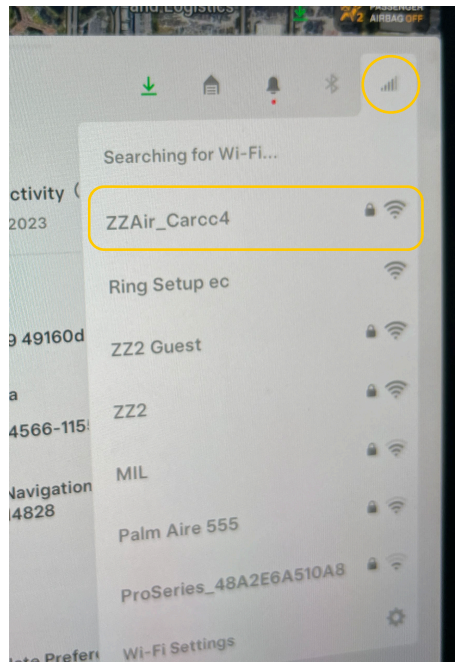

Once 'CarPlay' is connected (after pressing 'Use CarPlay', the phone icon (top) on the unit will emit solid green, you may connect the Tesla to the system using the following steps.

2. Verify the Phone Icon LED (on top of the unit) is emitting Green.
3. Press the CAR icon on the Tesla screen.
4. Press the (LTE) icon on the top right corner to choose connections.

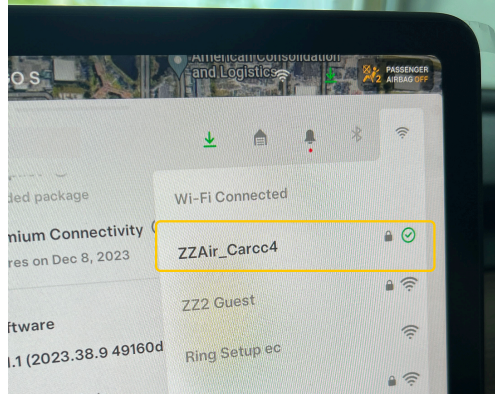

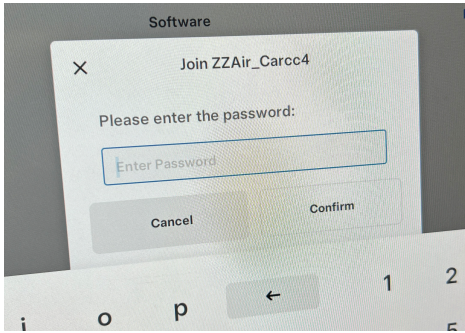

5. Choose the 'ZZAir_Carxxx' source for connection.

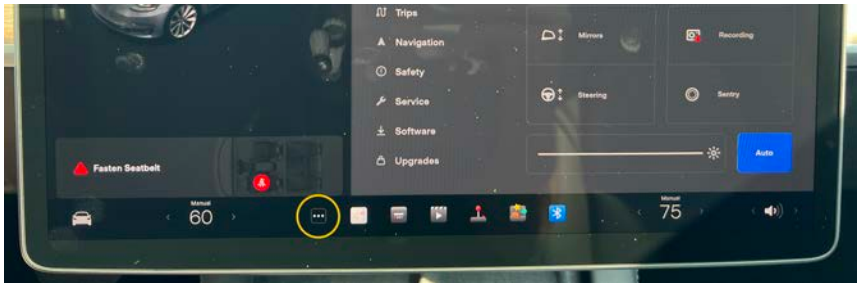

6. Once connected properly, the ZZAir_Carxx will show a green check. Be sure to choose 'Remain connected while driving' if that's an option on the Tesla firmware.

.. Enter password '1234567890'

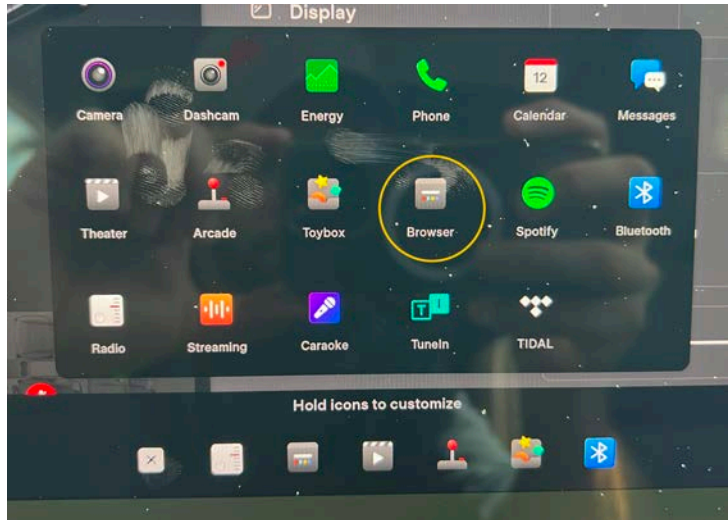

7. Now press the 'More apps' button (bottom left of lower pane)

8. Go to the Tesla Internet 'Browser'.

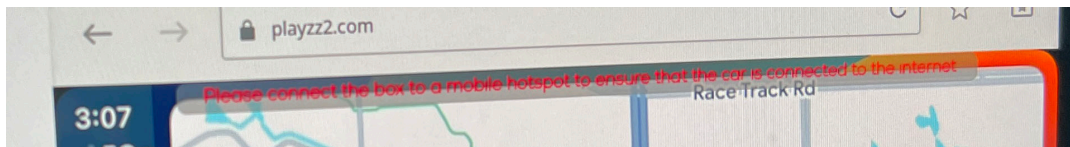

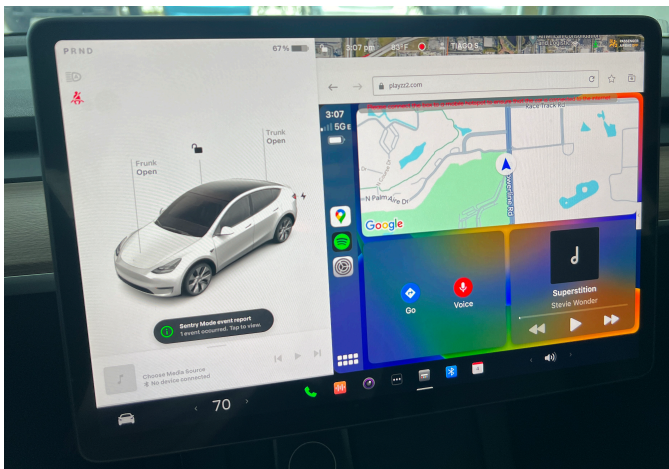

type in the URL:

playzz2.com

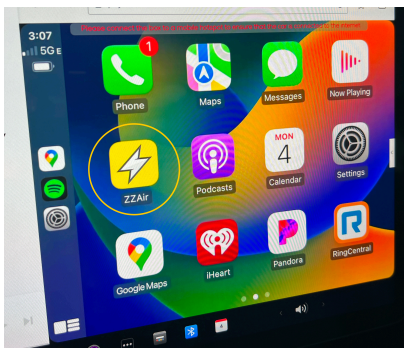

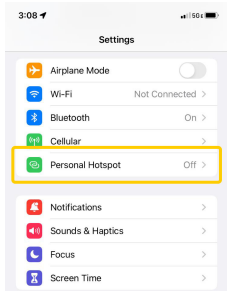

9. On the browser window once on 'playzz2.com', CarPlay should show display.

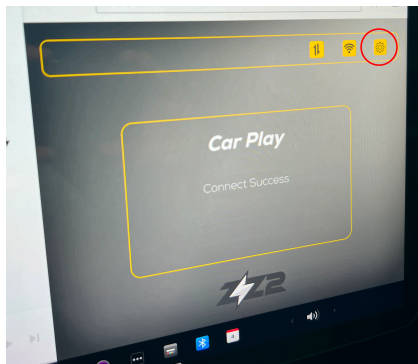

Choosing the 'ZZAir' tile will show you the ITZ-TSL interface main menu. This is where all settings to the unit and updates exist.

This message which appears at the top of the CarPlay screen warning about internet connectivity is shown to inform you the browser is no longer accessing the internet via LTE (a limitation of using this module). To correct this, you may connect to the phone's hotspot. Follow the steps below:

Select the ZZAir Tile

Choose the Settings gear

Go to Settings>Personal Hotspot and turn it ON.

Connect to the Hotspot just started with the iPhone - the message will disappear.

NOTES:

- The phone paired with the ITZ-TSL unit must also be paired (bluetooth) to the OE Tesla system for audio playback and phone call functionality. Use CarPlay as you normally would and in the OE system you must be resting in the Bluetooth source in order to hear audio playback.

- Auto connection upon entering the vehicle is dependent upon the vehicle's ability to connect to the provided hotspot supplied from the unit automatically. If you get an error when trying to load *playzz2.com* or CarPlay, verify the vehicle OS is connected to the ITZ-TSL (ZZAir_Carxx) and not on typical 5G service (step 4-5). Verify WIFI and BT are ON on the phone and connect CarPlay (via BT) to the ITZ-TSL and then refresh the browser page (or wait).
