

# Installation Instructions

## Voltage Scaling:

The Imtronics Battery State-of-charge meter is installed in a 52mm (2 -1/16") hole or in the optional Black Mounting panel.

## Meter without optional lighting

Cut 52mm (2-1/16") hole in dash of golf cart or use optional black mounting panel and attach to convenient location using two (2) screws (not supplied). Prepare two (2) 16AWG wires with 1/4" Female quick connect terminals (available in auto stores, electrical departments of Lowes, Home Depot etc.) on one end of the wire. Use black wire for Negative (-) and red wire for Positive (+) polarity. Slip the wires onto the meter terminals (Red to + and Black to -). Connect the other end of the Red (+) wire to the first battery's Positive (+) terminal. Connect the Black (-) wire to the last battery's Negative (-) terminal. The meter will always be "on".

## Optional lighting

Install meter as above. To connect lamp, locate the Negative (-) terminal and Positive (+) terminal on the rear of the key switch. Attach either wire coming from lamp to the Negative (-) terminal on the rear of the key switch. Connect the remaining lamp wire to the Positive (+) terminal on the rear of the key switch. Lamp will go on when key switch is on and go off when key switch is off.

**WARNING! If the polarity is reversed the gauge will be damaged beyond repair and void the warranty.**
