

## Flexipanel Dog Fence Instructions

The fence you have purchased will consist of a given amount of green mesh panels e.g. 10 panels for 10ft or 1 panel per running foot of fence required.

To build the fence, join each panel together on the 1m side with 4 Green snap connectors and continue until all the panels are secured together.

Due to the nature of the material the connectors are made from it is advisable they are soaked in a cup of warm water while assembly is taking place. This will make them a lot easier to snap onto the panels.

The zip ties are supplied as an extra security measure - attached on the top and bottom of each panel joint.

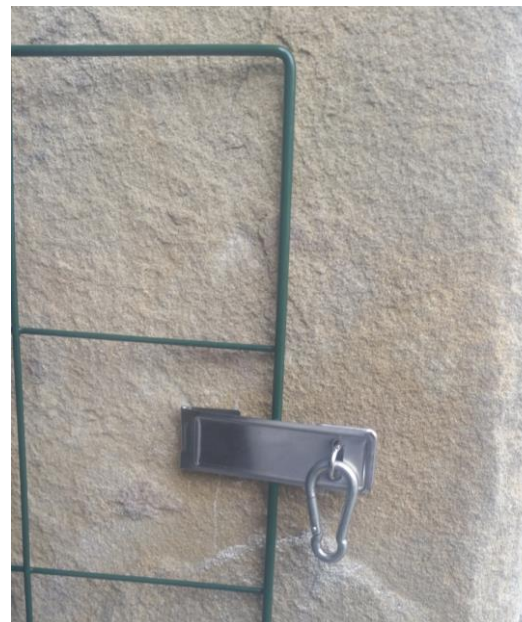

Next, place the secured panels in the position where the fence is required. Ensure the fence is in a zigzag shape with each point being as close to 90° as possible to give it the best stability.

Next, you will need to secure the un-opening end of the fence using the two wall hinge brackets. These will have to be screwed to the wall or fence with the screws and rawl plugs provided (rawl plugs are needed for securing to stone/brickwork)

Next, you need to secure the opening end of the fence with the hasp and staple. The hasp needs to be positioned against a flat surface preferably in the middle of the panel.

The panels can also be used to create a cage or pen, simply by putting the panels in a square, circle or rectangle and then simply connecting the ends with the carabiner.

Visit our website [www.pdotwolf.com](http://www.pdotwolf.com) for our full range of accessories, permanent fencing and other products.

Your Kit Will Contain:

2 Wall Hinge Brackets	Zip Ties
9 Brown Rawl Plugs	1 Hasp and Staple
9 Large Screws	Green Snap Connectors (4 per Panel)
