

## BR32265 DH Mosquito FB. VI Ammo Feed Chutes

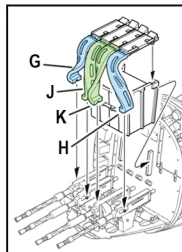

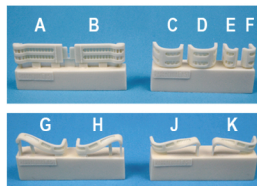

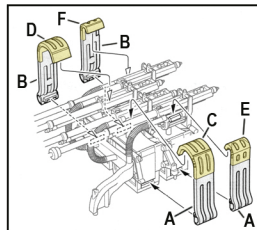

Designed for the superb 1/32  
Tamiya Mosquito FB. VI kit.

This set contains a complete set of feed chutes with ammunition visible through the slots for the 4 nose mounted .303 machine guns, as well as the 4 belly mounted 20mm cannons. This is a simple but dramatic, and very visible upgrade for the kit.

- 1) Carefully note which part goes where, as some parts look similar. Mark the inside of the part with pencil to prevent confusion. Note that the larger diameter cartridge visible through slots is always to the rear on the model. Saw parts from molding blocks & clean up any seams with sandpaper.
- 2) Build up the kit nose gun assembly and test fit the chutes to it. Make note of any fit issues and adjust. Repeat process with belly mounted cannon assembly. Assemble 20mm chutes. This is a good point to paint all parts. Feed chutes: dull aluminum or black. 20mm shells: dull brass cartridges with various projectiles. Red with white tip: Incendiary. Black with white tip: Armor piercing. Feed links: satin black. .303 rounds: dull brass

- 3) A thin black wash will pop out the details. Install feed chutes with Cyanoacrylate (super glue).

Happy modelling!
