

DynamX Tendon & Ligament

Clinical Applications

- Promotes the Body's Processes of Tendon/Ligament Self-Repair*
- Supports Tendon/Ligament Functions*
- Protects and Promotes Collagen Biosynthesis*
- Supports Tendon/Ligament Comfort*

DynamX Tendon & Ligament is an advanced formula designed to bolster tendon/ligament comfort and recovery. Whether repetitive use or something more acute is your challenge, preliminary research suggests that SynovX Tendon & Ligament can support the stability, health, and proliferation of tendon and ligament cells and thereby promote the body's ability for self-repair. Let DynamX Tendon & Ligament help you stay active.

All Absolute Health Formulas Meet or Exceed cGMP Quality Standards

Discussion

It is known that tendons and ligaments have a slower and more limited ability to self-repair than other tissues. However, healthy tendons and ligaments do indeed have an intrinsic capacity for repair, which is controlled by resident fibroblasts and their surrounding extracellular matrix (ECM).¹ Fibroblasts (e.g., tenocytes) are responsible for producing the ECM and therefore the proteoglycans (protein/mucopolysaccharide complex) and collagen needed for tissue repair. The key is to stimulate this process. In vitro and in vivo research suggests DynamX Tendon & Ligament does just that. This proprietary blend of type I collagen and mucopolysaccharides combined with vitamin C supports the structural and functional needs of tendons and ligaments.

Type I Collagen and Mucopolysaccharides Adult tendons are comprised mainly of type-I collagen molecules that are hierarchically organized into structural units. The molecular structure and organization of tendon and ligament collagen fibrils are key determinants in the ability of these tissues to endure mechanical force and fuel self-repair.¹ While collagen provides much of tendon/ligament structure and strength, mucopolysaccharides are said to provide the “glue” that holds them together and allows them to stretch, flex, bend, and maintain their resilience. Mucopolysaccharides—also known as glycosaminoglycans or GAGs—are a critical component of ECM and are important in maintaining structural integrity, lubrication, and spacing of collagen fibers. Furthermore, mucopolysaccharides have been shown to increase collagen and non-collagenous protein synthesis in cultures of bovine tenocytes and ligament cells.²

Vitamin C This vitamin helps maintain tendon/ligament structure and biomechanical properties by stimulating collagen biosynthesis.³⁻⁵

In Vitro IL-1beta (interleukin-1beta) is a cytokine associated with adverse tendon/ligament changes. The effect of DynamX Tendon & Ligament in the presence of IL-1beta was studied in primary human tenocytes. Tenocyte cultures treated with 250, 500, and 1000 µg/ml of DynamX Tendon & Ligament showed no signs of cytotoxicity or other negative effects on the viability of cells. The major findings were that this formula counteracted the negative effects of IL-1beta by: (1) protecting tenocytes from degenerative morphological changes, cellular degeneration, and apoptosis, (2) reversing the downregulation of collagen type I and beta 1-integrin receptor expression, (3) increasing tenomodulin production, and (4) causing a significant dose- and time-dependent increase in proliferation and viability of tenocytes. These results demonstrated that DynamX Tendon & Ligament supports tenocyte viability and proliferation and type I collagen synthesis.¹ Furthermore, the treated cells appeared healthy; displayed an abundant and well-organized ECM; and exhibited high levels of euchromatin, indicating that the cells were very active and had a high rate of protein (i.e., collagen) biosynthesis. [1] In another in vitro test, human tenocytes incubated with DynamX Tendon & Ligament for 10 days showed a strong stimulatory effect on cell proliferation that exceeded the proliferation seen in cells incubated with (IGF-1) insulin-like growth factor 1 (positive control).[6] In addition, cells remained viable and showed large amounts of endoplasmic reticulum, which is needed for synthesis of ECM.

In Vivo A prospective observational study performed by Nadal et al demonstrated the effects of DynamX Tendon & Ligament on the health of epicondyles, plantar fascia, Achilles tendons, or supraspinatus tendons. Patients were selected based on clinical assessment and ultrasound results. For three months, all the patients received 20 to 30 physical therapy sessions and the study group received two caps/d of DynamX Tendon & Ligament.[7] Comfort, quality of life (SF-36), and physiotherapist assessments were performed before intervention began and at 30-, 60-, and 90-day intervals during intervention. In every assessment, patients given DynamX Tendon & Ligament showed numerical or statistically significant improvements after two to three months of supplementation compared to controls.⁷ Researchers concluded that supplementing with DynamX Tendon & Ligament improved comfort level and biomechanical properties without adverse effects.

Several other human studies using DynamX Tendon & Ligament have demonstrated its positive effects on tendon comfort and structure.⁸⁻¹⁰ For instance, in a randomized placebo-controlled study (n = 60) designed to test the effects of DynamX Tendon & Ligament versus placebo on Achilles, supraspinatus, lateral epicondyle, and plantar fascia comfort and tendon structure, Binh et al found that subjects taking DynamX Tendon & Ligament (two caps/day) had significantly greater comfort at 90 days. At the end of the study, ultrasound assessment showed no signs of structural issues in the supplemented group.[8] In a prospective, randomized, controlled trial, 59 subjects were assigned to one of three groups: eccentric training, eccentric training plus DynamX Tendon & Ligament, or passive stretching plus DynamX Tendon & Ligament. Compared to physical therapy alone, the researchers found that supplementation with DynamX Tendon & Ligament provided additional benefits associated with comfort at rest and exercise recovery as well as changes in tendon thickness and vascularization in certain subjects.⁹

DynamX Tendon & Ligament

Supplement Facts

Serving Size: 2 Capsules
Servings Per Container: 30

	Amount Per Serving	%Daily Value
Vitamin C (ascorbic acid)	60 mg	100%
TENDOACTIVE® Proprietary Blend Mucopolysaccharides and Type I Collagen	520 mg	**

** Daily Value not established.

Other Ingredients: HPMC (capsule), microcrystalline cellulose, ascorbyl palmitate, silica, and medium-chain triglyceride oil.

TENDOACTIVE® is a registered trademark licensed by Bioiberica, S.A.

Directions

Take two capsules daily, or as directed by your healthcare practitioner.

Does Not Contain

Wheat, gluten, corn, yeast, soy, animal or dairy products, fish, shellfish, peanuts, tree nuts, egg, ingredients derived from genetically modified organisms (GMOs), artificial colors, artificial sweeteners, or preservatives.
