

Propel 1L

Application guidelines

Apply with a calibrated backpack sprayer using a flat fan nozzle then water it off the leaf and into the soil after application.

Measure your area

Product Rate is 100ml per 100m² every 4 weeks from September to April.

Water rate is 6-8l per 100m² though I am also happy to see it go out at 4L-6L per 100m² as it will all be getting washed straight into the soil post application with water anyhow.

You can apply this at any time of day.

It can be mixed with Gyp-Flo and WSF Seaweed.

For best application apply it after a mow or the day before a mow and water it in after application.

PPE required- Gloves, Shoes and long pants

Avoid contact on your skin and wash with soapy water straight away if you come into contact

Always read the label or SDS provided.
