

# **Pro Turf**

## **20-0-7+3 CaO +3 MgO**

### Application guidelines

Can be applied by either a hand spreader or walk behind spreader

Firstly measure out your area to work out your rate required

For lawn revival or your first application of the year use the 3.5kg per 100m<sup>2</sup> rate.

For a maintenance rate use the 2kg per 100m<sup>2</sup> rate. Do this every 10 weeks to achieve lawn success. If you have any weak areas do fertilise the area fortnightly with a handful per 1 meter squared until it heals over.

Apply to a dry leaf only.

You can get away without watering it in but for best results it's recommended that you water in within 24hours of application.

Start on a smaller setting like A or 1 then work your way up to achieve your desired Rate.

PPE required: Gloves

Always read the label or SDS provided
