Reference Stereo Preamplifier
PCM and DSD D/A Converter
Asynchronous USB

(Version 2.2 Firmware)
(Units Manufactured or Upgraded after 06/10/2016)

Safety Information

Fuses

CAUTION: FOR CONTINUED FIRE HAZARD PROTECTION ALWAYS REPLACE THE FUSES WITH THE CORRECT SIZE AND TYPE (0.5A 250 V SLO-BLO® 5 X 20 MM – LITTELFUSE® HXP218.500 OR EQUIVALENT). THE FUSE DRAWER INCLUDES TWO FUSES. ALWAYS REPLACE BOTH FUSES AT THE SAME TIME.

AC Input Voltage Range

NOTE: THE *DAC2* IS EQUIPPED WITH A UNIVERSAL POWER SUPPLY. THERE IS NO VOLTAGE SELECTION SWITCH. AC VOLTAGE RANGE IS 88-264 VAC, 50-60 HZ. THE PRODUCT MAY ALSO BE OPERATED FROM DC POWER OVER A VOLTAGE RANGE OF 125-373 VDC.

Power Cord

CAUTION: ALWAYS USE A GROUNDED POWER CORD. THE PRODUCT IS EQUIPPED WITH A STANDARD IEC POWER ENTRY MODULE. USE AN IEC POWER CORD THAT IS EQUIPPED WITH THE APPROPRIATE CONNECTOR FOR YOUR LOCATION. CORDS ARE AVAILABLE FROM YOUR DEALER.

Modifications

CAUTION: DO NOT SUBSTITUTE PARTS OR MAKE ANY MODIFICATIONS WITHOUT THE WRITTEN APPROVAL OF BENCHMARK MEDIA SYSTEMS, INC. MODIFICATION MAY CREATE SAFETY HAZARDS AND VOID THE WARRANTY.

CAUTION: CHANGES OR MODIFICATIONS NOT EXPRESSLY APPROVED BY BENCHMARK MEDIA SYSTEMS COULD VOID THE USER'S AUTHORITY TO OPERATE THE EQUIPMENT UNDER FCC REGULATIONS.

Repairs

CAUTION: DO NOT SERVICE OR REPAIR THIS PRODUCT UNLESS PROPERLY QUALIFIED. ONLY A QUALIFIED TECHNICIAN SHOULD PERFORM REPAIRS.

Features

- **HGC™** (Hybrid Gain Control) – combines a motor-driven active analog potentiometer, 32-bit digital attenuation, and passive analog attenuators, to achieve state-of-the-art performance
- **Low-Impedance Passive Output Pads** – 0, 10, and 20 dB – optimize output level to power amplifiers and other downstream devices to maximize system SNR
- **SABRE** - 32-bit PCM D/A conversion system, four 32-bit D/A converters per channel
- **SABRE** – Native DSD D/A conversion system, four 1-bit DSD D/A converters per channel
- **Benchmark UltraLock2™ Jitter Attenuation System** – eliminates jitter-induced distortion
- **High Headroom DSP** - provides 3.5 dB of analog and digital headroom above 0 dBFS to completely eliminate the clipping of inter-sample peaks
- **Multi-Mode Asynchronous USB Audio 2.0** – 24 bit/192 kHz, DSD (DoP 1.1)
- Driverless **Asynchronous USB Audio 1.1** – 24-bit/96 kHz
- **Sample Rate Display** – displays the measured sample rate, and format (PCM or DSD)
- **Word Length Display** – displays the measured word length
- **HPA2™** reference-grade "0-Ohm" **headphone power amplifier** with dual high-current outputs (**DAC2 HGC** only)
- **HPA2™** gain jumpers for customizing headphone output gain for headphone sensitivities (**DAC2 HGC** only)
- **2 Headphone Output Jacks** – one output has option to automatically mute main outputs (**DAC2 HGC** only)
- **2 Coaxial Digital Inputs** – 24-bit/192 kHz PCM, DSD (DoP 1.1)
- **2 Optical Digital Inputs** – 24-bit/96 kHz PCM
- **1 Coaxial Digital Output** – digital pass through from USB, Coax, and optical inputs when jumpered
- **2 Stereo Analog Inputs** – 2 pairs unbalanced (RCA)
- **3 Stereo Analog Outputs** – 1 pair balanced (XLR), plus 2 pairs unbalanced (RCA)
- **IR Remote** with metal housing provides control of all functions
- **HT Bypass** – places analog inputs in a unity-gain pass-through mode, sets digital inputs to a calibrated output level - all inputs can be individually programmed
- **Polarity Switch** – inverts the polarity of selected digital inputs
- **Mute** – accessible from remote or front panel
- **Dim** – Reduces output level by 20 dB, accessible from remote or front panel
- **Automatic De-Emphasis** – automatically responds to consumer pre-emphasis bit (44.1, 48 kHz)
- **12V Trigger I/O** – bi-directional 12V trigger can act as input, output, or both
- **Power Switch** – very low standby power , <0.5 W at 120 VAC
- **High-Efficiency Low-Noise Power Supplies** – only 12-15 W, 88-264 VAC, 50-60 Hz
- Meets FCC Class B and CE emissions requirements
- Tested for immunity to radiated and conducted RF interference

Introduction

Applications

The **DAC2** is a professional reference-grade audio digital to analog converter with Benchmark's **HPA2™** headphone amplifier. It supports 24-bit D/A conversion of PCM at sample rates up to 192 kHz. It also supports direct conversion of 1-bit DSD at a 2.8224 MHz sample rate. It is designed to be very transparent and this makes it well-suited for critical monitoring in studio control rooms and mastering rooms.

The **DAC2** is also well-suited for high-end hi-fi environments. It includes a generous collection of inputs and outputs and can serve as the central component in any stereo hi-fi system. It provides D/A conversion, source selection, volume control, and headphone amplification. A remote control, 12V trigger, and home theater bypass function provide the features needed in a home environment.

The **DAC2** is designed to directly drive a wide variety of power amplifiers and powered monitors. The balanced outputs include low-impedance passive pads that can be adjusted to optimize the interface between the **DAC2** and the power amplifier. This optimization can provide substantial improvements in the system-level SNR and THD+N performance.

DAC1 Heritage

The **DAC2** builds upon Benchmark's highly successful **DAC1** product family. The **DAC2** maintains the familiar **DAC1** form factor, but adds more features, and more I/O while delivering higher performance. Every **DAC1** subsystem has been redesigned, upgraded, or replaced in order to achieve the highest possible transparency.

System Overview

The **DAC2** adds these features that are not found on the **DAC1**:

- Asynchronous 192kHz USB Audio 2.0
- 32-bit D/A conversion system
- Word Length Display

- Sample Rate Display
- Polarity Control
- Direct DSD D/A Conversion
- -20 dB DIM
- Bi-Directional 12V Trigger
- Power Switch
- Home Theater Bypass
- Digital Pass-Through
- High-Headroom DSP
- Dual-Domain Hybrid Gain Control
- Additional I/O

Lower Noise than the DAC1

The conversion system in the **DAC2** is about 10 dB quieter than the system in the very quiet **DAC1**. To achieve this improvement, we selected the Sabre ES9018 8-channel 32-bit converter and externally summed two groups of four channels using two low-noise analog summing amplifiers of our own design. This 4:1 summing reduces the noise of the ES9018 by about 6 dB. The net result is 13.5 dB quieter than the converter in the **DAC1**. We have chosen to use 3.5 dB of this improvement to provide headroom above 0 dBFS so that intersample overs will never clip or overload the conversion system or the digital processing. This reduces the net improvement to 10 dB. Low-level musical details are faithfully reproduced over a breathtakingly quiet noise floor, and intersample peaks are faithfully reproduced without clipping.

No Clipping of Intersample Peaks

The **DAC2** is one of very few D/A converters that can accurately reproduce intersample peaks without clipping. Intersample overs commonly occur many times per second in 44.1 kHz and 48 kHz recordings. Additional overs are added whenever lossy compression systems (such as MP3) are applied. Most converters (including the **DAC1**) produce bursts of distortion at every occurrence. In contrast, the **DAC2** cleanly reproduces all intersample peaks.

Lower THD than the *DAC1*

Benchmark's *DAC1* converters are known for their very low distortion (THD and IMD). The *DAC2* sets new benchmarks for clean and transparent musical reproduction.

Low Power Consumption

The *DAC2* uses high-efficiency low-noise power supplies. Each critical subsystem also has at least one dedicated low-noise regulator. The unit runs cool while providing substantial power to the power-hungry low-noise circuits, headphone amplifier, and output line drivers. A power switch is included. The unit draws less than 0.5 W when off.

Low Magnetic Emissions

The magnetic components in the *DAC2* power supplies operate at over 800 kHz. This allows the use of very small magnetic components that emit correspondingly small magnetic fields. This virtually eliminates all traces of line-frequency components in the output spectrum of the *DAC2*. This also means that the *DAC2* can be placed in close proximity to any audio component without causing interference with the other component.

UltraLock2™ Clock System

UltraLock2™ provides the outstanding jitter attenuation of Benchmark's *UltraLock™* system while providing a higher SNR.

Dual-Mode USB Input

The *DAC2* has a USB input that can be operated in two modes; driverless USB Audio 1.1, and a high sample rate USB Audio 2.0. Both use asynchronous clocking to eliminate the USB interface as a source of clock jitter.

Asynchronous USB Audio 2.0

The USB Audio 2.0 interface supports DSD and 192 kHz, 24-bit PCM. No drivers are required for Apple operating systems. Drivers are provided for Windows operating systems at: <http://benchmarkmedia.com/dac/dac2-drivers>

Native Asynchronous USB 1.1

The *DAC2* has a driverless USB Audio 1.1 mode that supports 96 kHz, 24-bit PCM with all operating systems. This mode provides a quick and easy connection to a wide variety of computers and tablets without installing a driver.

New *HGC™* Hybrid Gain Control

HGC™ is Benchmark's unique hybrid gain control that combines analog and digital gain control into a single volume control knob. *HGC™* puts an end to the debate about analog versus digital gain controls, and passive versus active analog attenuation. The *HGC™* system uses an active analog gain control for analog inputs and a 32-bit dithered volume control for digital inputs. Both types of inputs leverage the low-impedance passive analog attenuation system at the XLR outputs.

The dual-domain *HGC™* system combines the high dynamic range of Benchmark's *HDR™* analog control (used in the *DAC1 HDR*) with the low distortion, and accuracy of digital control. *HGC™* outperforms traditional analog or digital volume controls, including the two-stage *DAC1 HDR™* system. Musical details are preserved over a very wide range of output levels. Analog inputs are controlled in the analog domain. Digital inputs are controlled in both domains.

The volume control is a servo-driven analog potentiometer. This control rotates in response to commands from the remote control while providing the convenience of manual adjustments with a physical knob.

Low-Impedance Passive Attenuators

Like the **DAC1**, the **DAC2** includes low-impedance passive attenuators on the XLR outputs. These attenuators can be adjusted to optimize the interface with the power amplifier or powered monitors. This optimization places the volume control in its best operating range. This exclusive Benchmark feature can provide substantial improvements in the performance of the playback signal chain.

Native DSD Conversion

The **DAC2** supports native DSD conversion. This feature was not available on the **DAC1**. DSD signals can be delivered to the USB or Coaxial inputs in DoP 1.1 format. The DSD signal is then routed directly to a bank of 1-bit DSD D/A converters. Four balanced 1-bit converters are summed together for each balanced output.

Digital Pass-Through

The second coaxial input (**D4**) can be reconfigured as a digital output. When operating as an output, any selected digital input is passed through to **D4** without any processing. Optical, coaxial, and USB inputs can be passed through to the **D4** connector. This even includes special signals such as DoP, DTS, Dolby Digital, even when these signals cannot be decoded by the **DAC2**.

Polarity Control

Each digital input can be inverted to correct polarity problems. Some listeners report that polarity is incorrect on some recordings, and that they enjoy an improved listening experience when this is corrected. To toggle, use the **POLARITY** button on the front panel or press and hold the **ON** button on the remote.

HT Mode

The **HT** mode sets the volume control to a calibrated level that is near its maximum setting. In **HT** mode the analog gain is set to 0 dB (unity gain). Likewise the digital attenuation is set to 0 dB (maximum output). The **HT** light is illuminated when the **HT** mode is active.

The **HT** mode is similar to the **CALIBRATED** switch setting on the **DAC1** except that it is programmable per input. This flexibility allows seamless integration into home theater systems where the **DAC2** handles the main left and right channels.

Bi-directional 12V Trigger

The 12 Volt trigger can be connected to other audio components so that an entire audio system can turn on and off in a sequenced fashion. The **DAC2** trigger I/O could be connected to a preamplifier, power amplifier, or both. The **DAC2** will pull the trigger I/O to 12 volts DC while the **DAC2** is on. If the **DAC2** is off and an external device pulls the trigger I/O to 12 volts, the **DAC2** will turn on.

Expanded I/O

The **DAC2 HGC** and **DAC2 L** have:

- 2 stereo unbalanced analog inputs
- 2 optical inputs
- 1 coaxial input
- 1 coaxial input or output (programmable)
- 1 USB input
- 2 stereo unbalanced outputs
- 1 balanced stereo output
- 1 bi-directional 12 volt trigger

Front Panel

DAC2 HGC

DAC2 L

Rear Panel

DAC2 HGC and DAC2 L

Quick Start Guide

Audio Inputs

The **DAC2** features two stereo RCA analog inputs and five stereo digital inputs (2 coaxial, 2 optical, and 1 USB). The coaxial and optical inputs accept professional (AES) and consumer (S/PDIF) data formats at word lengths up to 24-bits.

Tip: We recommend using the coaxial or USB inputs for sample rates above 96 kHz. Optical interfaces are not always reliable at sample rates above 96 kHz.

Remote Control

The remote control is designed to have a long operating range. In most applications it is not necessary to point the remote directly at the **DAC2**.

The chart at the right summarizes the functions of the IR remote control.

OFF	Turns the unit off. Any devices slaved to the 12V TRIGGER will also turn off in a controlled sequence. Press and hold the OFF button for 3 seconds to force the 12V TRIGGER off (only necessary when another device is acting as a TRIGGER BUS MASTER).
ON	Turns the unit on. Any devices slaved to the 12V TRIGGER will also turn on in a controlled sequence. Press and hold the ON button for 3 seconds to toggle the POLARITY function.
VOLUME	Turns the volume up or down.
DIM	Toggles the -20 dB DIM function.
MUTE	Toggles the MUTE function. Press and hold the MUTE button for 3 seconds to toggle the HT mode on the selected input.
INPUT	Selects the inputs.
D1	Selects optical digital input D1 .
D2	Selects optical digital input D2 .
D3	Selects coaxial digital input D3 .
D4	Selects coaxial digital input D4 .
USB	Selects USB input. Press and hold the USB button for 3 seconds to toggle between the USB 1.1 and USB 2.0 modes.
Analog	Selects analog input A1 and then toggles between A1 and A2 .

Front Panel Controls

The front panel controls duplicate all of the functions that are available from the remote control.

The chart at the right summarizes the functions of the front-panel controls.

<p>POWER</p>	<p>Turns the unit on or off. Any devices slaved to the 12V TRIGGER will also turn on or off in a controlled sequence.</p> <p>Press and hold the POWER button for 3 seconds to force the 12V TRIGGER off (only necessary when another device is acting as a TRIGGER BUS MASTER).</p>
<p>DIM/MUTE</p>	<p>Press once to toggle the -20 dB DIM function.</p> <p>Double tap to set the MUTE function.</p>
<p>INPUT</p>	<p>Selects the inputs.</p> <p>Press and hold both input buttons to toggle between the USB 1.1 and USB 2.0 modes.</p>
<p>VOLUME (knob)</p>	<p>This motor-driven knob can be turned by hand at any time (even when being driven by the motor).</p> <p>If HT mode is off, the motor drive will release when the knob is held or turned by hand. If HT mode is on, the motor drive will attempt to return the volume control to the HT setting.</p>

Front Panel Displays

There are sixteen status indicator lights on the front panel. At least one light will be illuminated whenever power is on.

Input Indicators

The input indicators show which input is selected.

A flashing light indicates an error on a digital input.

The **HT** light shows that **HT** mode is active.

A1	A solid blue light indicates that analog input A1 is selected.
A2	A solid blue light indicates that analog input A2 is selected.
U	A solid blue light indicates that the USB input is selected and operating normally. A blinking blue light indicates that the input is selected but a connection to a computer has not been established.
D1	A solid blue light indicates that optical input D1 is selected and operating normally. A blinking blue light indicates that the input is selected but audio data is not being received.
D2	A solid blue light indicates that optical input D2 is selected and operating normally. A blinking blue light indicates that the input is selected but audio data is not being received.
D3	A solid blue light indicates that coaxial input D3 is selected and operating normally. A blinking blue light indicates that the input is selected but audio data is not being received.
D4	A solid blue light indicates that coaxial input D4 is selected and operating normally. A blinking blue light indicates that the input is selected but audio data is not being received.

Note: **D4** cannot be selected if the **Digital Pass Through** function is enabled.

Instructions for configuring this jumper-selected function can be found in the **Internal Settings** section of this manual.

Input Error Codes

The input indicators flash when errors are present on the selected digital input. There are no error indications for analog inputs. Use the following table to diagnose the problem:

Slow Flash (2Hz)	No digital signal (output muted)
Med. Flash (7Hz)	Data transmission errors or Non-PCM (output muted)
Rapid flashes (14Hz)	Non-audio data is being received (output muted)
Intermittent flashes	Some data corruption is occurring, converter may be interpolating to replace invalid samples, check the cable.

Tip: Common causes of input errors:

- Disconnected or faulty cable
- Use of excessively long digital cables
- Use of analog cables for digital signals
- Use of optical cables for sample rates exceeding 96 kHz
- Incompatible data type (AC3, ADAT, etc.)
- Non-audio data is being received

HT Indicator

HT	A solid light indicates that the HT mode is active on the selected input and the volume control is in the factory calibrated position (near full clockwise). A blinking light indicates that the HT mode is active but the volume control has not yet reached its calibrated position. The HT light and DIM/MUTE light will blink together if the unit is muted while HT mode is active.
-----------	---

DIM, MUTE, and POLARITY Indicators

DIM/MUTE	A solid red light indicates that the unit is in DIM mode. A slow flashing red light indicates that the unit is in MUTE mode. A rapidly flashing red light indicates that the remote control is sending commands.
POLARITY	Yellow light indicates that the POLARITY inversion function is active.

Digital Format Indicators

Tip: Computers, disk players, and streaming devices often subject the digital signal to sample rate conversion, changes in word length, DSD to PCM conversions, and other forms of digital processing that may degrade the quality of the audio. This display makes it easy to detect these processes.

Word Length Indicators

The **16** and **24** lights indicate the measured word length of the selected digital input. The **DAC2** detects active data bits and displays the results as follows:

16 Only	Measured input word length is 16 bits.
16 and 24	Measured input word length is 17 to 23 bits.
24 Only	Measured input word length is 24 bits.
Both Off	Measured input word length is less than 16 bits.

Format indicators

The **44**, **48**, **2X**, **4X**, and **DSD** lights indicate the sample rate and format of the selected digital input as follows:

44 Only	The input format is PCM at a sample rate of 44.1 kHz (CD sample rate).
48 Only	The input format is PCM at a sample rate of 48 kHz (often used with video).
44 and 2X	The input format is PCM at a sample rate of 88.2 kHz (high-resolution audio format).
48 and 2X	The input format is PCM at a sample rate of 96 kHz (high-resolution audio format).
44 and 4X	The input format is PCM at a sample rate of 176.4 kHz (high-resolution audio format).
48 and 4X	The input format is PCM at a sample rate of 192 kHz (high-resolution audio format).
DSD (4x and 2X)	The input format is 1-bit DSD at a sample rate of 2.8224 MHz (high-resolution audio format). Note: DSD must be streamed in DoP format.
All Off	Digital signal is not present or is not in a supported format.

Headphone Jacks

(DAC2 HGC only)

The left-hand jack mutes the XLR and RCA outputs.	The right-hand jack keeps all outputs active.
---	---

Headphone Mute Switch

The left-hand headphone jack includes a switch that mutes the main analog outputs (XLR and RCA) when a headphone plug is inserted. This feature allows the listener to switch from loudspeaker to headphone playback seamlessly. This **Auto-Mute** feature can be disabled with internal jumpers.

Note: Instructions for setting the **Auto-Mute** jumpers can be found in the **Internal Settings** section of this manual.

Tip: Use the left-hand jack to mute your loudspeaker system. Use the right-hand jack to keep all outputs active.

Driving Two Sets of Headphones

The **HPA2™** is specifically designed with enough power to drive two sets of headphones.

Tip: The **Volume Control** simultaneously adjusts the level for both jacks. If two listeners will be simultaneously using the headphone outputs, we recommend using headphones with identical or similar voltage sensitivities.

HPA2™ Headphone Power Amplifier

The headphone jacks are driven by Benchmark's **HPA2™** headphone power amplifier. This small and very clean power amplifier can deliver the current and voltage required by some of the most demanding headphones. The output impedance of the **HPA2™** is very close to 0 Ohms. This low output impedance delivers a high damping factor so that the amplifier can maintain precise control over the headphone transducers.

Headphone voltage sensitivities vary substantially, so we have equipped the **HPA2™** with **Gain-Range** jumpers that can be used to customize the headphone amplifier to your favorite headphones. If you find that you have too much output (volume control set below 11 o'clock), or not enough output (volume control at maximum), there are internal jumpers that can be adjusted to increase or decrease the output level by 10 dB relative to the factory default setting.

Note: Instructions for setting the headphone **Gain-Range** jumpers can be found in the **Internal Settings** section of this manual.

Tip: For optimal performance, the headphone **Gain-Range** jumpers should be set so that comfortable listening levels occur when the volume control is set above the 11 o'clock position.

Operational Details

DIM and MUTE Functions

Definition: If the **DIM**, **MUTE**, and **HT** modes are all off, the **DAC2** is in **NORMAL** mode.

Definition: The **NORMAL** volume setting is the last volume setting that was in use before the **DIM**, **MUTE**, or **HT** modes were activated.

DIM Function

The **DIM** function reduces the output level by 20 dB. To toggle between **NORMAL** and **DIM** volume, press the **DIM** button on the remote or the **DIM/MUTE** button on the front panel.

The red **DIM/MUTE** light will turn on whenever **DIM** is active.

When **DIM** is activated, the **NORMAL** volume setting is stored in memory while the volume control ramps down by 20 dB. When **DIM** is deactivated, the volume control ramps back to the **NORMAL** volume setting that was stored in memory.

The **DIM** function makes it convenient to fade back and forth between normal and background playback volume levels.

TIP: In the studio, the **DIM** function allows a temporary reduction in level without losing the volume setting that was being used for monitoring.

Tip: In home applications the **DIM** function allows temporary reductions in volume during TV commercial breaks, phone calls, or other interruptions, without losing the volume setting that was being used for normal listening.

If the volume is adjusted while **DIM** is active, it will not change the **NORMAL** setting unless the **DIM** volume is turned up above the last **NORMAL** setting. If the volume control is

turned up by more than 20 dB after **DIM** is activated, the **DIM** mode will automatically deactivate, the **DIM** light will turn off, and the saved **NORMAL** setting will be replaced by the current volume setting.

DIM cannot be activated when **HT** mode is enabled.

With digital inputs, **DIM** will reduce the output level by exactly 20 dB. With analog inputs, **DIM** will reduce the output level 20 dB +/- 0.5 dB.

MUTE Function

The **MUTE** function immediately mutes all outputs. To toggle this function, press the **MUTE** button on the remote or double-tap the **DIM/MUTE** button on the front panel.

The red **DIM/MUTE** light will flash at a 1 Hz rate whenever **MUTE** is active.

When **MUTE** is activated from a **NORMAL** listening mode, the audio will immediately mute while the motor-driven volume control ramps down to the -20 dB **DIM** position. When **MUTE** is released, the output will unmute at the **DIM** volume position and then ramp back up to the previous setting. This movement of the motor-driven volume control provides a soft unmute when **MUTE** is released. It also allows immediate transitions between **MUTE** and **DIM**.

Tip: If the unit is in **MUTE**, press the **DIM** key to immediately enter the **DIM** mode.

Tip: If the unit is in **MUTE**, press the **ON** key to enter the **NORMAL** mode.

Tip: if the unit is in **DIM**, press the **MUTE** key to toggle between **DIM** and **MUTE**.

Bi-directional 12V Trigger

Benchmark has reinvented the 12 volt trigger by adding bidirectional signaling. The trigger connection on the **DAC2** can be used as an input, an output, or both. It is compatible with any common 12 volt trigger input or output. The **12V TRIGGER** I/O can be used to turn other audio components on when the **DAC2** turns on. The **DAC2** can also turn on and off in response to other connected components. The Benchmark bi-directional **12V Trigger** is compatible with virtually all trigger systems.

The **12V TRIGGER** I/O can be connected to the trigger input or output ports on a preamplifier, power amplifier, or both.

The **DAC2** can send a 12 Volt DC trigger signal to start other components in the system, or it can wake up in response to an externally generated trigger signal. The **DAC2** automatically configures its trigger I/O port as an input (slave) or output (master).

Trigger Output (**DAC2** is Master)

When the **DAC2** is turned on using the **POWER** button (on the front panel), or the **ON** button (on the remote), the **DAC2** configures itself as a trigger master and will drive the **12V TRIGGER** I/O to 12 volts DC and hold it there while the **DAC2** is on. The trigger output signal generated by the **DAC2** is delayed so that the **DAC2** can stabilize before downstream devices (such as power amplifiers) turn on. When powering down, the **DAC2** will mute before allowing the trigger line to drop low. The **DAC2** keeps the internal power supplies running for 10 seconds after dropping the trigger. This delay gives other triggered components ample time to mute and shut down.

If the **AUTO-ON** function is enabled, the **DAC2** will automatically turn on when AC power is applied, configure itself as a trigger master, and ignore any external signaling on the **12V TRIGGER** I/O line. In **AUTO-ON** mode, the **DAC2** will always drive the **12V**

TRIGGER I/O line to 12 V (after a short start-up delay).

Trigger Input - (**DAC2** is Slave)

If the **DAC2** is off and an external device pulls the trigger I/O to 12 volts, the **DAC2** will configure itself as a trigger slave and will follow the actions of the trigger input. The **DAC2** will then turn off when the external device stops sending the 12 V trigger.

Typical Trigger Applications

In most systems, the **12V TRIGGER** will be used to connect the **DAC2** to one other device. The **DAC2** can be connected to the first trigger input at the beginning of a trigger chain, or it can be connected to the last trigger output at the end of the chain (less common).

Typical trigger applications:

- **DAC2** → Amplifier
- **DAC2** → Amplifier → Amplifier
- **DAC2** → Preamplifier → Amplifier
- AVR → **DAC2**, and AVR → Amplifier (AVR with 2 trigger outputs controls **DAC2** and power amplifier)

Trigger Bus Applications

The Benchmark bi-directional trigger system also supports multiple trigger ports wired together on a bus.

A group of Benchmark trigger ports can be connected to a group of non-Benchmark trigger input ports to form a single trigger bus. A bus should never be connected to more than one non-Benchmark trigger output port. If an output port is connected to the bus, this device should be used to start the audio system.

Benchmark **AHB2** power amplifiers have two trigger I/O ports that are wired in parallel. This makes it easy to connect more than one power amplifier to a trigger bus. Connect a trigger cable between the **DAC2** and the first

amplifier. Use another trigger cable to connect this amplifier to the next amplifier. Any number of Benchmark amplifiers can be added to the trigger bus. The **DAC2** will turn on first, and after a delay, all of the amplifiers will turn on together.

Bi-Directional Trigger Applications

Benchmark products support bi-directional communications over a trigger bus. Any Benchmark product connected to the bus can turn the entire system on or off. Because of the bi-directional design, any power button on a Benchmark **DAC2** or **AHB2** can be used to start or stop the system.

The Benchmark device that starts the system will become the trigger master. If the trigger master is turned off, all slave devices will follow. If a slave device is turned off, all other devices will stay on.

If the **DAC2** is used to turn the system on, any connected **AHB2** amplifiers will become slave devices and they can be turned off without shutting down the **DAC2**. This feature makes it easy to turn the **AHB2** amplifier(s) off when listening to headphones.

Slave devices can force the entire trigger bus to shut down if the **POWER** button or **OFF** button is pressed and held for 3 seconds.

Trigger Specifications

The Benchmark **12V TRIGGER** I/O has a wide operating range to allow interfacing with most other DC trigger systems. It should only be used with trigger inputs that are designed to tolerate 12 VDC.

- 12 VDC 200 mA current-limited output
- Input responds to 3.3 V logic and higher
- Maximum input voltage = 30 VDC
- Maximum reverse input voltage = -0.3 VDC
- Input Impedance = 20 k Ohms
- 1/8" (3.5 mm) TRS jack
- Tip = 12 Volt Trigger I/O
- Ring = no connection

- Sleeve = chassis ground

HT Mode

The **HT** mode sets the volume control to a calibrated level that is near its maximum setting. In **HT** mode the analog gain is set to 0 dB (unity gain). Likewise the digital attenuation is set to 0 dB (maximum output). The **HT** light is illuminated when the **HT** mode is active.

Each input channel can be programmed individually by pressing and holding the mute button for three seconds. In **HT** mode, analog inputs are passed at unity gain, and digital inputs are passed at maximum gain. The **HT** mode is similar to the **CALIBRATED** switch setting on the **DAC1** except that it is programmable per input. This flexibility allows seamless integration into home theater systems where the **DAC2** handles the main left and right channels.

The **HT** mode has three distinct applications:

- **Volume Control Bypass** - useful when the system has an upstream digital volume control or a downstream analog volume control
- **Home Theater Bypass** - allows high-quality stereo playback on a system that is also used for surround applications
- **Calibrated Output** - useful in studio applications where calibrated levels are needed

HT Mode - Volume Control Bypass

The **HT** mode is useful whenever the system volume will be controlled before or after the **DAC2**. It is usually best to avoid having two cascaded volume controls in a playback system. Dual controls will usually degrade the noise performance of the system and they can lead to confusion.

If the **DAC2** feeds a preamplifier, the preamplifier will provide a downstream analog

volume control for the system and the **DAC2** should be placed in **HT** mode for all inputs.

If the **DAC2** is directly feeding an amplifier, but one or more sources have volume controls, the sources with volume controls can be set to **HT** mode.

Example 1: The **USB** input is fed from a computer that has an internal digital volume control. If you wish to use the volume control in the computer exclusively, you will want to program the **USB** input with the **HT** mode on. All other inputs will have the **HT** mode turned off. If you do not wish to use the computer volume control, leave the **HT** mode off and disable the computer volume control (or set it to maximum).

Example 2: One of the analog inputs on the **DAC2** is fed from a preamplifier with an analog volume control that you wish to use. Set this analog input to **HT** mode on.

HT Mode - Home Theater Bypass

The home theater bypass is useful when you have a home theater system that will also be used for playing stereo recordings. The **DAC2** will directly drive the left and right power amplifiers while the AVR drives all other speakers. The analog left and right line-level outputs of the AVR will be connected to one set of analog inputs on the **DAC2** (usually **A1**). Stereo sources will be connected directly to the digital inputs on the **DAC2**. Surround sources will be connected directly to the inputs on the AVR.

When playing stereo recordings, digital feeds are sent directly to the **DAC2** and the volume control on the **DAC2** is used to control the playback level (**HT** mode must be off on all digital inputs). This configuration gives the best-possible performance for stereo applications because it eliminates the AVR from the stereo playback chain. If the stereo system includes a turntable and an outboard phono preamplifier, the outputs of the phono preamplifier can be connected directly to the second set of analog inputs on the **DAC2** (**HT** mode off, analog input **A2**).

When playing movies and other surround sources, analog signals from the AVR would pass through the **DAC2** at unity gain (**HT** mode on, analog input **A1**).

For stereo applications, digital sources would feed the **DAC2** and the volume control on the **DAC2** would control the playback level (**HT** mode off, digital inputs).

HT Mode – Calibrated Output

Any digital input can be set to a factory-calibrated fixed-gain by turning the **HT** mode on. In **HT** mode, the digital audio output is set to a fixed audio level. This mode is useful in studio applications where calibrated interface levels are used between various pieces of equipment. (Note: This function is similar to the calibrated mode on the **DAC1**.)

USB MODE Selection

The **DAC2** supports two **USB MODES**:

- **USB Audio 1.1** mode - up to 24 bits at 96 kHz
- **USB Audio 2.0** mode - up to 24 bits at 192 kHz plus DSD in DoP 1.1 format

Caution: Close all USB audio playback applications before changing the **USB MODE**. If an audio application is playing while the **USB MODE** is changed, the audio application may freeze.

Note: The computer and **DAC2** must be connected and both must be on before the **USB MODE** can be changed.

To change the **USB MODE**, select the **USB (U)** input on **DAC2** and then press and hold the **USB** button on the remote control for 3 seconds. If a remote control is not available, simultaneously press and hold both **INPUT** buttons on the front panel for 3 seconds.

After holding the button(s) for 3 seconds, either the **4X** lamp or the **2X** lamp will flash

once indicating the new **USB MODE**. A flash of the **4X** lamp indicates that the unit is now in **USB Audio 2.0** mode. A flash of the **2X** lamp indicates that the unit is now in **USB Audio 1.1** mode.

Tip: The **4X** or **2X** lamp will flash once every time the **USB** input is selected. This flash provides a convenient indication of the current **USB MODE**.

Tip: Avoid any unnecessary switching between **USB MODES**. Rapid switching between modes can confuse some operating systems.

Driving Power Amplifiers

The **DAC2** is designed to directly drive virtually any audio power amplifier or powered monitor. This direct connection provides the cleanest and shortest path from the digital source to the monitor output.

Tip: Benchmark does not recommend placing audio devices between the **DAC2** and the power amplifier unless these devices are providing an indispensable system function. A direct connection between the **DAC2** and the power amplifier will always provide the best system-level performance (SNR and THD+N).

The **RCA** and **XLR** outputs on the **DAC2** are equipped with low-impedance high-current drivers. These robust outputs are well equipped to drive a wide variety of input impedances. The **DAC2** outputs remain clean when driving amplifiers that present difficult loads (high input capacitance and/or low input impedance).

The **XLR** outputs on the **DAC2** are equipped with jumper-configured passive low-impedance output pads. These pads can be set to an attenuation of **0 dB** (pad off), **10 dB**, or **20 dB**. The pads should be used to match the output level of the **DAC2** to the input sensitivity of the power amplifier. Most power amplifiers and powered monitors will require the use of the **10 dB** or **20 dB** pads.

Use the **0 dB** setting when driving a Benchmark **AHB2** power amplifier.

Tip: The Benchmark **AHB2** power amplifier has a unique low-gain topology that allows it to accept full studio-level input signals. This high-level interconnection provides a very low-noise connection between the **DAC2** and the **AHB2**. Set the input **SENSITIVITY** switch on the **AHB2** to **22 dBu** (all the way down). This places the **AHB2** full-power output point at an input level of 22 dBu. This level is exactly 2 dB lower than the maximum output level of the **DAC2** (when the pads are set to **0 dB**). This configuration optimizes the gain-staging between the **DAC2** and the **AHB2** while placing the **DAC2** volume control in the proper range.

Tip: If you are using a **DAC2** with non-Benchmark power amplifiers, the **XLR** pads should be set so that comfortable listening levels occur when the **VOLUME** control is set above 11 o'clock. This will optimize the gain-staging between the **DAC2** and your power amplifier.

Tip: Increase the pad setting if a comfortable listening level is reached at a **VOLUME** control setting below the 11 o'clock position.

Tip: Decrease the pad setting if a comfortable listening level cannot be reached when the **VOLUME** control is fully clockwise.

Instructions for setting the **XLR** pad jumpers are detailed in the **Internal Settings** section of this manual. The **DAC2** is shipped with the **XLR** pads disabled (set to **0 dB**). No adjustments will be necessary if you will be using a Benchmark **AHB2** power amplifier.

HPA2™ Headphone Amplifier

(**DAC2 HGC** model only)

The left headphone jack has a mute switch that mutes all of the analog outputs on the back of the **DAC2**. The right headphone jack does not have a mute switch. The audio output on both jacks is wired in parallel and is driven

by Benchmark's **HPA2™** headphone power amplifier.

The **HPA2™** is one of the most transparent headphone amplifiers available. It also is able to deliver high current and/or high signal levels making it well suited for a wide variety of headphones. The near 0-Ohm output impedance provides outstanding damping of headphone drivers. This damping reduces distortion while maintaining precise control of the frequency response at the output of the amplifier.

Digital Pass-Through

The second coaxial input (**D4**) can be reconfigured as a digital output. When operating as an output, any selected digital input is passed through to **D4** without any processing.

Optical, coaxial, and USB inputs (**U**, **D1**, **D2** and **D3**) can be passed through to the **D4** connector. The signals are buffered but are not processed in any way. For this reason, any data format can be passed through to the **D4** connector, even when these formats cannot be decoded by the **DAC2**. Surround formats such as DTS, Dolby Digital, cannot be decoded by the **DAC2**, but they can be passed to a surround system using the digital pass-through function.

Rear Panel

DAC2 HGC and **DAC2 L**

The digital pass-through can also be used to provide the following digital signal conversions:

- Optical to Coaxial
- USB to Coaxial
- Coaxial to Coaxial (buffering)

DoP encapsulated DSD can also be passed through **D4**. DSD files on a computer can be sent in DoP to the **USB** input on the **DAC2**. The **USB** input can be routed to coaxial output **D4**. This output can be recorded by any 24-bit, 176.4 kHz digital recorder with a coaxial input. The PCM digital recorder can then be used to play the DSD recordings.

Firmware Version Identification

The firmware version is displayed during the lamp test while the **DAC2** is turning on. At least one lamp in the **INPUT INDICATOR** will flash rapidly while the remaining lamps will be on. The flashing lamps identify the firmware version. The values of each lamp

Digit 1	Digit 2
8 D1	D2 .8
4 U	D3 .4
2 A2	D4 .2
1 A1	HT .1

are shown in this chart. Add the values of all flashing lamps to determine the version number.

Inputs

There are seven stereo inputs on the **DAC2**:

- **A1** - RCA L & R Analog Inputs
- **A2** - RCA L & R Analog Inputs
- **USB** - USB Audio 1.1 or 2.0 Input
- **D1** - Optical Digital Input
- **D2** - Optical Digital Input
- **D3** - Coaxial Digital Input
- **D4** - Coaxial Digital Input or Output*

These inputs are selected using the **INPUT** buttons on the front-panel or on the remote-control.

* **D4** can be jumper-configured as a digital **PASS-THROUGH** output. When enabled, the selected digital input will be routed to the internal D/A converter and to output **D4**. The selected input will be buffered and sent to output **D4** even if the format cannot be decoded by the **DAC2**.

The digital inputs support PCM stereo AES/EBU and SPDIF digital formats. Maximum word length is 24-bits. Maximum sample rate is 192kHz.

The digital inputs also support DSD stereo at a sample rate of 2.8224 MHz using DoP 1.1 encapsulation.

The **USB** input has two operating modes:

- **USB Audio 1.1** - PCM up to 24-bits at 96 kHz
- **USB Audio 2.0** - PCM up to 24-bits at 192 kHz and DSD (DoP 1.1 format)

Caution: The optical inputs (**D1** and **D2**) are not recommended for DSD or for sample rates above 96 kHz. Optical connections may be unreliable at sample rates above 96 kHz.

Tip: The **DAC2** will not decode multichannel digital formats such as AC3, and Dolby Digital. The audio will mute and the **INPUT INDICATORS** will flash whenever an incompatible format is connected to the selected digital input. If the **PASS-THROUGH** mode is enabled, these multichannel formats can be sent to a surround processor using connector **D4** as a digital output.

Caution: The **12V TRIGGER** I/O is not an audio connection! This is a 12V DC connection for synchronizing the on and off sequencing of an entire audio system.

Analog Inputs – RCA Unbalanced

The **DAC2** has two sets of unbalanced stereo analog inputs with female RCA connectors.

The analog inputs can be used for devices such as:

- Phono preamplifiers
- FM Tuners
- Tape Transports
- Analog VCR outputs
- iPod and MP3 devices
- Outputs from analog mixing consoles

Digital Inputs - Overview

All of the digital inputs on the **DAC2** use Benchmark's **UltraLock2™** system to remove virtually all of the interface jitter. The result is that all digital inputs deliver identical audio performance. The USB, optical, and coaxial digital inputs will all sound identical if they receive identical data.

Computer Input – USB

The **USB** input accepts a **Type-B** male USB connector. A **Type-A to Type-B** USB cable is provided with the **DAC2**. The USB cable connects the **DAC2** directly to a computer's USB output.

The **USB** input supports 44.1, 48, 88.2, 96, 176.4, and 192 kHz PCM sample rates at word lengths up to 24-bits. The **USB** input also accepts DSD in DoP 1.1 format.

The **DAC2** can be configured as a **USB Audio 1.1** or **USB Audio 2.0** device. Press and hold the **USB** button on the **REMOTE** for three seconds to toggle the **USB MODE**. If a remote is not available, simultaneously press and hold both input buttons on the front panel for three seconds.

The **USB AUDIO 1.1** mode does not require the installation of a driver. It allows a quick driverless connection to windows machines when playing sample rates of 96 kHz or less. In this mode, Windows machines can begin

streaming audio within seconds after the **DAC2** is connected for the first time. No software or hardware configuration is usually required.

USB Audio 2.0 is required for DSD and for all PCM sample rates exceeding 96 kHz. Windows computers require a driver to support the **USB Audio 2.0** mode.

The **USB Audio 1.1** mode was tested for compatibility with Windows XP, Vista, 7, 8 and 10, Mac OS X, and iPads using the 30-pin to USB Camera Kit. No driver installation is required for any of these systems when operating in **USB Audio 1.1** mode.

The **USB Audio 2.0** mode was tested for compatibility with Windows XP, Vista, 7, 8 and 10 (driver installation is required for all Windows versions). It was also tested for compatibility with Mac OS X starting with version 10.6 (operation is driverless for all OS X versions).

Optical Digital Inputs - D1 and D2

The optical input connectors (**D1** and **D2**) are commonly known as **TOSLINK** connectors. The **TOSLINK** optical connectors used on the **DAC2** are designed to work well at sample rates up to 96 kHz. Maximum word length is 24-bits. All sample rates between 28 and 96 kHz are supported. The optical inputs may be unreliable at sample rates above 96 kHz. The optical inputs will accept professional AES/EBU data formats or consumer S/PDIF data formats.

Tip: The optical inputs include dust caps. Keep these in place if the input is not being used.

Coaxial Digital Inputs - D3 and D4

The coaxial digital inputs (**D3** and **D4**) use female RCA connectors. The input impedance is 75 Ohms. Maximum word length is 24-bits. All sample rates between 28 and 195 kHz are supported. The coaxial digital inputs will accept professional AES/EBU data formats or consumer S/PDIF data formats. The coaxial inputs also accept DSD in DoP 1.1 format.

The coaxial digital inputs are DC isolated, current limited, and diode protected. The RCA body is bonded directly to the chassis to prevent currents in the internal ground system. This direct bonding also maximizes RF shielding.

Caution: Use 75-Ohm coaxial cables for digital audio connections **D3** and **D4**. Digital interfaces require the use of matched impedances. Do not use 50-Ohm coaxial cables, twisted pair cables, or any non-coaxial cables for digital audio. The digital inputs may not function, or may be unreliable if the incorrect cable is used.

Tip: The RCA analog inputs and outputs have no restrictions on cable type. To avoid confusion, we recommend using 75-Ohm coaxial cables for all RCA connections. 75-Ohm coaxial cables are compatible with digital audio, analog audio, and video.

Note: The Coaxial inputs (**D3** and **D4**) accept professional or consumer digital audio formats. The AES3-id and SMPTE 276M standards specify a 75-Ohm, 1 Vpp, professional format which is also known as AES/EBU and is commonly used in video production facilities. The IEC 609588-3 standard specifies a 75-Ohm, 0.5 Vpp, consumer format which is also known as S/PDIF, and is commonly used in hi-fi equipment. The coaxial inputs are designed to accept either type of signal.

12V TRIGGER I/O

The Benchmark bi-directional **12V TRIGGER** is compatible with virtually all trigger systems. The **12V TRIGGER** I/O connection

on the **DAC2** can be used as an input, an output, or both. It is compatible with most 12 volt trigger inputs and outputs. The **12V TRIGGER** can be used to turn other audio components on when the **DAC2** turns on. The **DAC2** can also turn on and off in response to trigger signals sent from other components.

The **12V TRIGGER** I/O can be connected to the trigger input or output ports on a preamplifier, power amplifier, or both.

The **DAC2** can send a 12 Volt trigger signal to start other components in the system, or it can wake up in response to an externally generated trigger signal. The **DAC2** automatically configures the **12V TRIGGER** I/O port as an input (slave) or output (master). See the **Bi-directional 12V Trigger** section for more information.

The Benchmark **12V TRIGGER** I/O has a wide operating range to allow interfacing with most other DC trigger systems. It should only be used with trigger inputs that are designed to tolerate 12 VDC.

- 12 VDC 200 mA current-limited output
- Input responds to 3.3 V logic and higher
- Maximum input voltage = 30 VDC
- Maximum reverse input voltage = -0.3 VDC
- Input Impedance = 20 k Ohms
- 1/8" (3.5 mm) TRS jack
- Tip = 12 Volt Trigger I/O
- Ring = no connection
- Sleeve = chassis ground

Caution: The **12V TRIGGER** I/O is not an audio connection! This is a 12V DC connection for synchronizing the on and off sequencing of an entire audio system.

Outputs

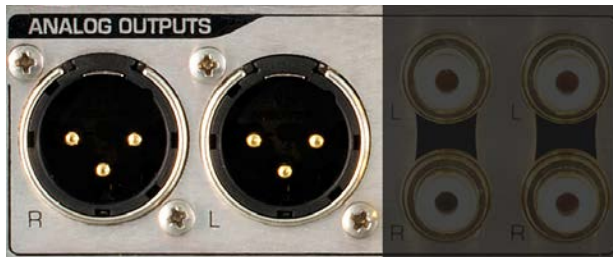

Analog Outputs

The **DAC2** has one pair of balanced XLR outputs and two pairs of unbalanced RCA outputs.

The **DAC2** features high-current output drivers that are capable of driving 300-Ohm loads without an increase in distortion. They are also well suited for driving long cables or high-capacitance loads.

Balanced XLR Analog Line Outputs

The Left and Right balanced outputs use Neutrik™ gold-pin male XLR jacks. The XLR shell and pin 1 (ground) are both directly bonded to the chassis to prevent currents in the internal ground system. This direct bonding also maximizes RF shielding.

The XLR outputs have passive attenuators that allow direct connections to a wide variety of audio devices without a loss of dynamic range. The 10 or 20 dB pads are usually required for direct interfacing to power amplifiers and powered speakers. The **DAC2** ships with the pads disabled (0 dB setting). Use the 0 dB setting with the Benchmark **AHB2** power amplifier. A full description of the output attenuators and instructions for

configuration is located in the **Internal Settings** section of this manual.

Industry-Standard XLR Wiring

- XLR pin 2 = + Audio Out
- XLR pin 3 = - Audio Out
- XLR pin 1 = Cable Shield

Caution: If the balanced XLR outputs are wired to an unbalanced input (using a special adapter cable), pin 3 must be left floating. Shorting pin 3 to ground will increase the temperature of the output drivers, will increase power consumption, and may cause distortion.

Unbalanced RCA Analog Outputs

The Left and Right unbalanced outputs use female RCA jacks. The ground connections are bonded to chassis ground at the location where analog ground is bonded to the chassis. This minimizes the effects of ground loops caused by AC currents in the cable shield. The RCA output impedance is very low (30 Ohms). This makes these outputs well suited for driving high-capacitance loads and/or high-capacitance cables.

Caution: Mono summing with an RCA 'Y' cable is not recommended as this will cause high amounts of distortion. Mono summing with a 'Y' cable can be accomplished with the use of a modified cable by implementing a 1k Ohm series resistor in each leg of the 'Y'.

Note: The XLR pads do not have any effect on the level of the RCA outputs.

AC Power-Entry and Fuse Module

Fuses

Caution: For continued fire hazard protection always replace the fuses with the correct size and type (0.5A 250 V Slo-Blo® 5 x 20 mm – Littelfuse® HXP218.500 or equivalent). The fuse drawer includes two fuses. Always replace both fuses at the same time.

Input Voltage Range

Note: The **DAC2** is equipped with a universal power supply. There is no voltage selection switch. AC voltage range is 88-264 VAC, 50-60 Hz. The product may also be operated from DC power over a voltage range of 125-373 VDC.

Power Cord

Note: The AC power input uses a standard IEC type connector. One USA-compatible power cord is included with **DAC2** converters. IEC style power cords in country-specific configurations are available in your locality.

Caution: Always use a grounded power cord. The **DAC2** is equipped with a standard IEC power entry module. Use an IEC power cord that is equipped with the appropriate connector for your location. Cords are available from your dealer.

Internal Settings

Jumper-Configured Options

The following functions are jumper configured:

- XLR Output Pads
- Headphone Mute Switches
- Headphone Gain
- Digital Pass-Through

Removing Top Cover

The **DAC2** cover must be removed to gain access to the jumpers. Do not attempt to remove the faceplate or rear panel.

Caution: The **DAC2** contains static sensitive components. Static discharge may cause component failures, may affect the long-term reliability, or may degrade the audio performance. Use a static control wrist strap when changing jumper settings.

- Disconnect AC power by unplugging the power cord at the back of the **DAC2**.
- Remove the 8 screws holding the cover (4 on each side).
- Do not remove any screws on the front, rear, or bottom panels!
- Never remove the power entry safety cover in the rear corner of the **DAC2**.
- Always connect a static-control wrist strap to the chassis before touching any internal component.

XLR Output Pads

The XLR outputs are equipped with low-impedance passive pads that may be used to reduce the output levels while preserving the full dynamic range of the **DAC2**. The **DAC2** ships with the pads disabled (**0 dB** setting).

Tip: Use the **0 dB** setting with Benchmark's **AHB2** power amplifier. When directly driving other power amplifiers or powered speakers, start with the **10 dB** pad setting. If necessary, change the pads so that normal listening levels are achieved with the **VOLUME** control above the 11 o'clock position.

When the output pads are enabled, the output impedance changes slightly, and the maximum allowable cable length should be reduced as shown in Table 1 (assuming 32 pF/foot and a maximum allowable loss of 0.1 dB at 20 kHz).

Table 1 - Cable Drive Capability

Balanced Output Drive Capability:				
Attenuator Setting (dB)	Output Impedance	Maximum Cable (ft)	Loss in dB at 20 kHz	
0	60	680	0.1	
10	425	96	0.1	
20	135	302	0.1	

Unbalanced Output Drive Capability:			
	Output Impedance	Maximum Cable (ft)	Loss in dB at 20 kHz
	30	1360	0.1

Tip: To set the XLR outputs to typical professional studio levels, set the pads to **0 dB**. For most home installations, set the pads to **10 dB** or **20 dB**.

Headphone Amplifier Gain

(DAC2 HGC only)

The gain range of the **HPA2™** can be set using jumpers **JP3** and **JP4**:

- **0 dB** attenuation - see **Figure 4**
- **10 dB** attenuation - see **Figure 5** (Factory Default)
- **20 dB** attenuation - see **Figure 6**

The attenuation is inserted before the **HPA2™** headphone amplifier. This attenuator location keeps the output impedance of the **HPA2™** constant and very near 0 Ohms. External attenuators should never be inserted after a headphone amplifier as this would change the output impedance.

Proper attenuator settings are important for maximizing the SNR of the headphone monitoring system. With proper settings, the full performance of the **DAC2** can be delivered to the headphones for critical monitoring tasks, or maximum musical enjoyment.

Tip: When the headphone attenuation jumpers are set properly, a normal listening level will be achieved at a **VOLUME** control setting above the 11 o'clock position.

Tip: If a normal listening level is achieved below an 11 o'clock **VOLUME** setting, the headphone gain is too high, and the attenuation should be increased.

Tip: If the level is too low at the maximum **VOLUME** setting, the headphone gain is too low, and the attenuation should be decreased.

Figure 4 - 0 dB Headphone Attenuation

Figure 5 - 10 dB Headphone Attenuation

Figure 6 - 20 dB Headphone Attenuation

Digital PASS-THROUGH Function

The digital **PASS-THROUGH** function can be enabled by moving both **P14** jumpers toward the faceplate shown in **Figure 7**. Once the jumpers are moved into the position shown in **Figure 7**, **D4** is configured as a digital audio output. When the **PASS-THROUGH** function is enabled, **D4** cannot be selected as an input. Any other selected digital input will be routed to both the internal D/A converter and to output **D4**. The digital output at **D4** is buffered, but is not processed. Many digital audio formats can be passed through to **D4** (even when these formats cannot be decoded by the **DAC2**).

By default, **D4** functions as a digital input and the jumpers are set according to **Figure 8**.

Figure 7 – Digital PASS-THROUGH Enabled

Figure 8 - Digital PASS-THROUGH Disabled (Factory Default)

Rack Mounting

An optional rack mount tray allows the mounting of any two ½-wide Benchmark products in a single rack space. A blank plate can be added when only one unit is installed in the rack mount tray.

The **Benchmark Rack Mount Tray** and **Benchmark ½-Wide Blank Plate** are available from Benchmark.

Benchmark Rack Mount Tray

The **Benchmark Rack Mount Tray** mounts up to two ½-wide Benchmark products in a single rack space. The tray accepts any combination of ½-wide Benchmark products (with or without rack-mount type faceplates).

Benchmark ½-Wide Blank Plate

The **Benchmark ½-Wide Blank Plate** is a ½-wide 1-RU anodized aluminum panel for covering an unused slot in the **Benchmark Rack Mount Tray**. It is available in black or silver.

Visit BenchmarkMedia.com for a complete selection of cable, accessories, and replacement parts.

Benchmark Technologies

DAC1 and DAC2 Family History

The pristine audio performance of the award-winning **DAC1** made it the 'Benchmark' of stand-alone D/A converters. The **DAC1 USB**, **DAC1 PRE**, and **DAC1 HDR** added many features to the basic **DAC1** platform. Benchmark **DAC1** and **DAC2** converters are in use in many of the world's top studios.

The following is a brief overview of the various Benchmark **DAC1** and **DAC2** models:

DAC1

Benchmark's original **DAC1** converter.

The **DAC1** features included:

- Three digital inputs
- XLR outputs with passive pads
- RCA outputs
- Analog volume control
- **HPA2™** headphone amplifier
- **UltraLock™** jitter-attenuation system

DAC1 USB

The **DAC1 USB** introduced these improvements:

- **AdvancedUSB™** computer input
- Mute switch on the left headphone jack
- Two headphone gain ranges
- High-current LM4562/LME49860 output stages - designed to drive difficult loads
- Lower output impedances

Benchmark's **AdvancedUSB™** computer input was the first USB audio interface to support 96 kHz audio without the need to install special drivers.

DAC1 PRE

The **DAC1 PRE** added these improvements:

- Three coaxial digital inputs
- Three Headphone Gain Ranges
- LM4562/LME49860 opamps throughout
- Premium bulkhead-mounted RCA connectors

The **DAC1 PRE** eliminated the XLR digital input found on the **DAC1** and **DAC1 USB**.

DAC1 HDR

The **DAC1 HDR** added these improvements:

- IR Remote Control
- **HDR-VC™** (high dynamic range volume control).

The **HDR-VC™** features a custom-made, motor-driven Alps potentiometer. The motor-driven control provides the audio performance of a manual control while adding the convenience of remote control.

DAC2 HGC

The **DAC2** maintains the familiar **DAC1** form factor, but internally, it is a complete redesign. The **DAC2** features:

- Four 32-bit D/A per output channel
- Native 24-bit/192kHz PCM conversion
- Native DSD conversion
- Multi-mode asynchronous USB audio input
- Sample rate and word length displays
- **UltraLock2™** jitter attenuation
- Polarity control
- Home theater bypass
- Digital pass-through
- Bi-directional 12V trigger
- Two stereo analog inputs
- Three stereo analog outputs
- Two optical inputs
- High-efficiency low-noise power supplies

Hybrid Gain Control™

HGC™ is Benchmark's unique **Hybrid Gain Control™** system. The **DAC2** combines active analog gain control, passive low-impedance attenuators, a 32-bit digital gain control, and a servo-driven volume control.

All inputs are controlled by the rotary volume control. This volume control moves in response to commands from the remote control. Analog inputs are never converted to digital, and digital inputs never pass through an analog potentiometer. Digital inputs are precisely controlled in the 32-bit DSP system. The DSP system preserves precise L/R balance, and precise stereo imaging, while avoiding any source of noise and distortion.

Benchmark's unique passive output attenuators provide distortion-free gain reduction without reducing the dynamic range of the converter. The attenuators optimize the gain staging between the **DAC2** and the power amplifier. This optimization is absolutely essential for maximizing the dynamic range of the entire playback system. Much of the success of the **DAC1** and **DAC2** converters can be attributed to the passive output attenuators. Musical details can be obscured by system noise whenever a preamplifier and power amplifier are improperly matched. The **HGC™** system will make full use of your power amplifier's dynamic range. Experience newly revealed details in your favorite recordings.

The front-panel volume control is a servo-driven gain control built around a custom-made Alps potentiometer. The custom Alps pot is equipped with remote-controllable motor drive.

This potentiometer is equipped with a clutch which prevents damage from overriding the motor drive. If the pot is driven beyond the end of its range, it will not damage the motor. Also, if the pot is manually overridden, it will not damage the motor.

Native DSD Conversion

The digital coaxial inputs and the **USB Audio 2.0 input** on the **DAC2** support native DSD conversion. DoP 1.1 DSD encapsulation is automatically detected on all digital inputs. The system seamlessly switches to native DSD conversion when DoP is detected. DoP 1.1 DSD encapsulation is supported by many media players. DSD downloads are now available from several sources.

Visit our website for an up-to-date list of DSD and PCM high resolution download sites.

Jitter-Immune *UltraLock2™*

UltraLock2™ is an improved version of the **UltraLock™** system used in the **DAC1** product family. DSP processing is 32-bits, DSP headroom is 3.5 dB, sample rate is 211 kHz, and jitter-induced distortion and noise is at least 160 dB below the level of the music - well below the threshold of hearing. Benchmark's **UltraLock2™** system eliminates all audible jitter artifacts.

High Headroom DSP

All of the digital processing in the **DAC2** is designed to handle signals as high as +3.5 dBFS. Most digital systems clip signals that exceed 0 dBFS. The 0 dBFS limitation seems reasonable, as 0 dBFS is the highest sinusoidal signal level that can be represented in a digital system. However, a detailed investigation of the mathematics of PCM digital systems will reveal that inter-sample peaks may reach levels slightly higher than +3 dBFS while individual samples never exceed 0 dBFS. These inter-sample peaks are common in commercial releases, and are of no consequence in a PCM system until they reach an interpolation process. But, for a variety of reasons, virtually all audio D/A converters use an interpolation process. The interpolation process is absolutely necessary to achieve 24-bit state-of-the-art conversion performance. Unfortunately, inter-sample overs cause clipping in most interpolators.

This clipping produces distortion products that are non-harmonic and non-musical. We believe these broadband distortion products often add a harshness or false high-frequency sparkle to digital reproduction. The **DAC2** avoids these problems by maintaining at least 3.5 dB of headroom in the entire conversion system. We believe this added headroom is a groundbreaking improvement.

32-bit SABRE Conversion System

Four balanced 32-bit D/A converters deliver audio to Benchmark's low-impedance current to voltage converters. The 4:1 redundancy reduces noise by 6 dB. The redundancy also reduces the THD. The conversion system at the core of the **DAC2** is as good as it gets. The analog circuits that follow the D/A converter are carefully designed. Benchmark has leveraged its long history of building reference analog audio equipment to create an outstanding output stage.

Diagnostic Displays

Ever wonder why that 192 kHz 24-bit download on your computer just doesn't sound right? Your media player or computer may be downsampling to 44.1 kHz and/or truncating to 16-bits. Many media players and computer operating systems apply poor-quality sample rate conversion and/or truncation. Fortunately these problems can be eliminated with the selection of a good frequency-agile media player.

Many disk players also downsample all sources to 44.1/16. This processing can do significant damage to the audio quality.

The sample-rate and word-length displays on the **DAC2** confirm the proper operation of your disk player, media player, and computer.

Bi-Directional 12 Volt Trigger

Benchmark has re-invented the 12 volt trigger. The trigger connection on the **DAC2**

can be used as an input or output or both, and is compatible with any common 12 volt trigger input or output. The trigger can be used to turn a power amplifier on or off automatically. The **DAC2** will also respond to a 12 volt trigger and follow the actions of another audio component.

Benchmark components can communicate bi-directionally on the trigger I/O ports. This bidirectional communication provides greater flexibility. In a given system, the power button on any Benchmark device can be used to start or stop the entire audio system in a sequenced manner.

Distributed Power Regulation

To achieve the lowest possible noise, the **DAC2** uses distributed power supply regulation. Each critical subsystem has at least one dedicated low-noise voltage regulator.

We have created a discrete ultra low-noise regulator for the ES9018 D/A converter. This Benchmark exclusive feature improves the noise performance of the already-outstanding ES9018.

HPA2™ Headphone Amplifier

The **DAC2** headphone output is driven by Benchmark's signature **HPA2™** headphone power amplifier. This high-current, high-output amplifier has an output impedance of near 0-Ohms. It is designed to drive loads as low as 30 Ohms without any increase in distortion. It also has sufficient amplitude to drive low-sensitivity 600-Ohm headphones.

The **HPA2™** includes current-limiting circuits that fully protect against damage from short circuits. This is important because the right channel of a headphone amplifier will experience a short whenever a mono phone plug is inserted into the stereo headphone jack. Shorts may also occur when a plug is partially inserted.

0-Ohm Output Impedance

Most headphone amplifiers use series resistors to maintain stability and protect against short-circuit conditions. These resistors are usually at least 30 Ohms, and have a negative impact on performance. A headphone amplifier with series resistors may measure very well on a test bench when driving resistive loads. However, the same amplifier will measure very poorly when driving a headphone load. Unfortunately, most manufacturers do not measure or specify headphone amplifier performance when loaded with real headphones. The measurements use ideal resistive loads. Our measurements show that headphones do not behave like resistive loads.

Headphone Performance

In our tests we have measured substantial distortion across resistors that are wired in series with headphones. We have conducted measurements with a variety of headphones. In general, distortion increases as headphone impedance decreases. This distortion can be eliminated with a properly designed 0-Ohm headphone amplifier.

The performance of the **HPA2™** does not change when headphones are driven. THD+N measurements for no-load, 30-Ohm resistive loads, 30-Ohm headphone loads, and 600-Ohm headphone loads are virtually identical. The **HPA2™** will substantially improve the sound of 30 and 60-Ohm headphones. It will make very noticeable improvements with 600-Ohm headphones.

Differential Amplifiers

Differential amplifiers remove common-mode distortion components from the D/A converter outputs. This feature is critical for achieving low-distortion in down-stream devices. Benchmark addresses common-mode distortion so that it will not cause distortion in power amplifiers and other connected devices. Common-mode distortion can cause audible distortion while escaping the scrutiny of an audio analyzer. The balanced and

unbalanced outputs on the **DAC2** deliver very similar performance.

Many D/A converters omit the differential amplifiers after the converters. Specifications usually ignore common-mode distortion. A balanced signal with high common-mode distortion can measure just fine when feeding a precisely balanced input on a high-quality audio analyzer. However, any imbalance in a downstream device will expose the common-mode distortion.

UltraLock2™ Clock System

Accurate 24-bit audio conversion requires a very low-jitter conversion clock. Jitter can very easily turn a 24-bit converter into a 16-bit converter (or worse). There is no point in buying a 24-bit converter if clock jitter has not been adequately addressed.

Jitter is present on every digital audio interface. This type of jitter is known as 'interface jitter' and it is present even in the most carefully designed audio systems. Interface jitter accumulates as digital signals travel down a cable from one digital device to the next. If we measure interface jitter in a typical system we will find that it is 10 to 10,000 times higher than the maximum allowable level for accurate 24-bit conversion. Fortunately, interface jitter has absolutely no effect on the audio unless it influences the conversion clock in an analog-to-digital converter (A/D), the conversion clock in a digital-to-analog converter (D/A), or the rate estimator in an asynchronous sample rate converter (ASRC).

Many converters use a single-stage Phase Lock Loop (PLL) circuit to derive their conversion clocks from AES/EBU, wordclock, or superclock reference signals. Single-stage PLL circuits provide some jitter attenuation above 5 kHz but none below 5 kHz. Unfortunately, digital audio signals often have their strongest jitter components at 2 kHz. Consequently, these converters can achieve their rated performance only when driven from very low jitter sources and through very

short cables. It is highly unlikely that any converter with a single-stage PLL can achieve better than 16 bits of performance in a typical installation. Specified performance may be severely degraded in most installations.

Better converters often use a two-stage PLL circuit to filter out more of the interface jitter. In theory, a two-stage PLL can remove enough of the jitter to achieve accurate 24-bit conversion (and some do). However, not all two-stage PLL circuits are created equal. Many two-stage PLLs do not remove enough of the low-frequency jitter. In addition, two-stage PLL circuits often require several seconds to lock to an incoming signal. Two-stage PLL circuits may fail to lock when jitter is too high, or when the reference sample frequency has drifted.

UltraLock™ converters exceed the jitter attenuation performance of two-stage PLL converters while achieving near instantaneous lock time. They are free from the slow-lock and no-lock problems that can plague two-stage PLL designs. **UltraLock™** converters have extremely high immunity to interface jitter under all operating conditions.

The **UltraLock™** system is so effective that no jitter-induced artifacts could be detected using an Audio Precision System 2 Cascade test set while the inputs to the **DAC2** were exposed to high levels of interface jitter. The measurement limits included the ability to detect artifacts as low as -144 dBFS, but none could be detected, even while applying jitter amplitudes as high as 12.75 UI, over a frequency range of 2 Hz to 200 kHz. Any AES/EBU signal that can be decoded by the AES/EBU receiver in the **DAC2** will be reproduced without the addition of any measurable jitter artifacts.

Benchmark's **UltraLock2™** technology eliminates jitter-induced performance problems. **UltraLock2™** technology isolates the conversion clock from the digital audio interface clock. Jitter on a D/A digital audio input, or an A/D reference input can never have any measurable effect on the conversion clock of an **UltraLock2™** converter. In an

UltraLock2™ converter, the conversion clock is never phase-locked to a reference clock. Instead the converter oversampling-ratio is varied with extremely high precision to achieve the proper phase relationship to the reference clock. The clock isolation of the **UltraLock2™** system ensures that interface jitter can never degrade the quality of the audio conversion. Specified performance is consistent and repeatable in any installation with cables of any quality level!

How does conversion clock jitter degrade converter performance?

Problem #1: Jitter phase-modulates the audio signal. This modulation creates sidebands (unwanted tones) above and below every tone in the audio signal. Worse yet, these sidebands are often widely separated from the tones in the original signal.

Jitter-induced sidebands are not musical in nature because they are not harmonically related to the original audio. Furthermore, these sidebands are poorly masked (easy to hear) because they can be widely separated above and below the frequencies of the original audio tones. In many ways, jitter induced distortion resembles intermodulation distortion (IMD). Like IMD, jitter induced distortion is much more audible than harmonic distortion, and more audible than THD measurements would suggest.

Jitter creates 'new audio' that is not harmonically related to the original audio signal. This 'new audio' is unexpected and unwanted. It can cause a loss of imaging, and can add a low and mid frequency 'muddiness' that was not in the original audio.

Jitter-induced sidebands can be measured using an FFT analyzer while the converter plays a pure high-amplitude tone. We typically use a full-scale 10 kHz test tone to test for the presence of jitter-induced sidebands (see Plot 15). This FFT shows that the **DAC2** is free from any jitter-induced sidebands to a measurement limit of about -144 dB relative to the level of the test tone.

The plot used 31 different jitter frequencies ranging from 100 Hz to 100 kHz.

Problem #2: Jitter can severely degrade the anti-alias filters in an oversampling converter. This is a little known but easily measurable effect. Most audio converters operate at high oversampling ratios. This allows the use of high-performance digital anti-alias filters in place of the relatively poor performing analog anti-alias filters. In theory, digital anti-alias filters can have extremely sharp cutoff characteristics, and very few negative effects on the in-band audio signal. Digital anti-alias filters are usually designed to achieve at least 100 dB of stop-band attenuation. But, digital filters are designed using the mathematical assumption that the time interval between samples is a constant. Unfortunately, sample clock jitter in an A/D or D/A varies the effective time interval between samples. This variation alters the performance of these carefully designed filters. Small amounts of jitter can severely degrade stop-band performance, and can render these filters useless for preventing aliasing.

The obvious function of a digital anti-alias filter is the removal of audio tones that are too high in frequency to be represented at the selected sample rate. The not-so-obvious function is the removal of high-frequency signals that originate inside the converter box, or even originate inside the converter IC. These high-frequency signals are a result of crosstalk between digital and analog signals, and may have high amplitudes in a poorly designed system. Under ideal (low jitter) conditions, the digital anti-alias filter may remove most of this unwanted noise before it can alias down into lower (audio) frequencies. These crosstalk problems may not become obvious until jitter is present.

Stop-band attenuation can be measured very easily by sweeping a test tone between 24 kHz and at least 200 kHz while monitoring the output of the converter.

Put *UltraLock™* converters to the test:

We encourage our customers to perform the above tests on *UltraLock2™* converters (or let your ears be the judge). There will be absolutely no change in performance as jitter is added to any digital input on an *UltraLock2™* converter. Try the same tests on any converter using conventional single or two-stage PLL circuits. Tests should be performed with varying levels of jitter and with varying jitter frequencies. The results will be very enlightening. Jitter related problems have audible (and measurable) effects on A/D and D/A devices. Practitioners of Digital Audio need to understand these effects.

Is it possible to eliminate all of the effects of jitter in an entire digital audio system?

Interface jitter will accumulate throughout even the most carefully designed digital audio system. Fortunately, **interface jitter** can only degrade digital audio if it affects the sampling circuit in an analog-to-digital or digital-to-analog converter. Any attempt to cure jitter outside of an A/D or D/A will prove expensive and, at best, will only partially reduce jitter-induced artifacts. Dedicated clock signals (word clock, and super clock, etc.) are often distributed to A/D converters and D/A converters in an attempt to reduce jitter. Again, these are only partial solutions because jitter even accumulates in these clock distribution systems. Furthermore, a poor quality master clock generator can degrade the performance of the entire system (if converter performance is dependent upon reference clock quality). Jitter-free A/D and D/A converters are the only true insurance against the ill effects of jitter. *UltraLock2™* converters are jitter-immune under all operating conditions (they will never add audible jitter-induced artifacts to an audio signal).

What *UltraLock™* converters cannot do:

UltraLock2™ converters cannot undo damage that has already been done. If an A/D with a jitter problem was used to create a

digital audio signal, then there is nothing that can be done to remove the jitter-induced distortion that happened inside the A/D converter. Jitter-induced sidebands are extremely complex and cannot be removed with any existing audio device. Therefore, it is very important to attack jitter at both ends of the audio chain. The **DAC2** is a great start, as it will allow accurate assessment of various A/D converters. It is impossible to audibly evaluate A/D performance without a good D/A. The consistent performance delivered by the **DAC2** eliminates one major variable - jitter.

Multi-Mode Asynchronous USB Audio

Plug it in and Start Listening... Immediately

Benchmark's **Advanced USB Audio** system supports **USB Audio 1.1** and **USB Audio 2.0** modes. Both modes are frequency agile. The **DAC2** will follow sample rate changes initiated by the computer and/or the media playback software.

In all modes the USB communications are asynchronous. An ultra low jitter conversion clock is generated inside the **DAC2**. The asynchronous USB interface pulls data from the computer without using computer-generated clocks. The D/A conversion in the **DAC2** is completely isolated by the asynchronous USB interface and by the **UltraLock2™** jitter-attenuation system.

The **DAC2** has a low-jitter master clock which controls the transfer of audio data from the computer to the USB sub-system. The computer asynchronously transfers audio data to a buffer in the **DAC2**. The contents of the buffer are then asynchronously transferred to the D/A conversion sub-system. This second asynchronous transfer eliminates any traces of jitter that accumulate as the data is transferred between the USB and conversion

subsystems. No traces of jitter-induced distortion are measurable to our measurement limits (better than -140 dBFS). This truly represents the state-of-the art. Enjoy the convenience of computer playback without compromise.

The Asynchronous USB system supports **USB Audio 2.0** for high-resolution 192kHz, and DSD playback. No drivers are required for MAC operating systems. An easy-to-install driver adds 192 kHz and DSD capabilities to Windows operating systems.

The asynchronous driverless **USB Audio 1.1** mode supports sample rates up to 96 kHz. This USB mode can be selected from the front panel or from the remote control. The driverless **USB Audio 1.1** mode allows quick plug-and-play connections to Windows, MAC, iOS, and Linux operating systems without installing drivers. Just plug in the USB, and the **DAC2** becomes an available audio device. In many cases, audio will automatically be routed to the newly connected device. If not, it can be selected as the current or default playback device.

The industry-standard **USB Audio Mode 2.0** mode is not yet natively supported by the current Windows operating systems. For this reason, a driver is required for Windows operating systems. The driver supports Windows XP, Vista, or 7, 8 and 10. This driver is required for DSD and sample rates above 96 kHz when using Windows.

The USB subsystem is computer powered (through the USB cord) and it remains active when the **DAC2** is powered down. This feature prevents interruptions to the computer playback operations and eliminates the need to reconfigure the computer every time the converter is turned on.

The Windows driver is available at:

BenchmarkMedia.com/dac/dac2-drivers

USB Driver Installation

Windows Operating Systems

Note: The **DAC2** driver is available for download at: BenchmarkMedia.com/dac/dac2-drivers

Before you install the driver, make sure the USB cable is unplugged.

1. In the DAC2 Driver folder, double click "setup.exe."

2. A welcome screen will pop-up. Click "Next."

3. When you see the following screen, turn on the **DAC2**, plug in the USB cable, and select the **USB** input on the **DAC2**. By default, the **DAC2** is shipped in **USB Audio 1.0** mode. Do not proceed to the next step until the **USB Audio 2.0** mode has been enabled. You can enable the **USB Audio 2.0** mode using one of the following two methods:

- **METHOD 1 - REMOTE CONTROL:** Using your remote control, press and hold USB button for 3 seconds (the **4X** light should flash once). If the **2X** light flashes instead of the **4X** light, repeat this step.
- **METHOD 1 - FRONT PANEL:** From the front panel, simultaneously press and hold both **INPUT** buttons for three seconds (the **4X** light should flash once). If the **2X** light flashes instead of the **4X** light, repeat this step.

4. You will now be prompted to select a location to install the driver. It will default to your Program Files folder. If you wish to install it another location, you can change the location. We suggest keeping it in the default location. Click "Install".

5. When the installation begins you will see the following screen. Please be patient while the driver installs. Installation may require several minutes.

- When the installation finishes a message at the top will say "Installation Complete." Click "Next" to continue.

- Click "Finish." The Setup will close automatically. This completes the installation process. You can now enjoy music over the **USB Audio 2.0** connection at sample rates up to 192 kHz. DSD can also be played in DoP 1.1 format.

Performance Graphs

Audio Precision

FFT Idle Channel Noise, 0 dBr = 0 dBFS = 23 dBu

Sweep	Trace	Color	Line Style	Thick	Data	Axis	Comment
1	1	Green	Solid	4	Fft.Ch.1 Ampl	Left	
1	2	Red	Solid	4	Fft.Ch.2 Ampl	Right	

DAC2 - FFT Idle Channel Noise.at27

Graph 1 – FFT Idle Channel Noise

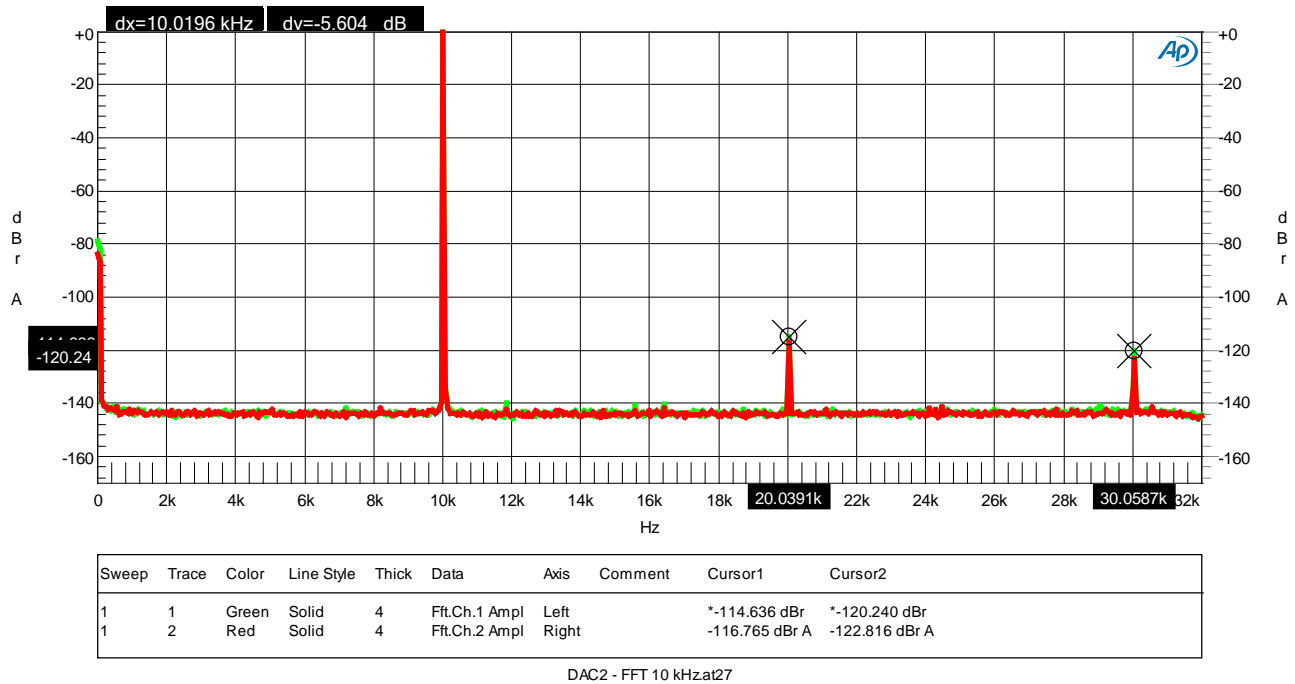

The extraordinary performance of the **DAC2** is demonstrated by the FFT plot shown above. There is no sign of any AC hum, there are no idle tones, and there are no spurious tones detected at a measurement limit of -160 dBFS.

The rise at 0 Hz is normal in an FFT analysis and is not an indication of noise. This 32k point FFT analysis uses a Blackman-Harris window with 16x power averaging, and spans a frequency range of DC to 32 kHz.

Graph 2 - Low Frequency FFT - AC Line-Related Hum

The **DAC2** shows no evidence of AC line-related hum to a measurement limit of -160 dBFS. The cursors are placed at 60 Hz and 180 Hz (frequencies where we would expect to see interference from the 60 Hz AC input). There is absolutely no sign of any AC hum.

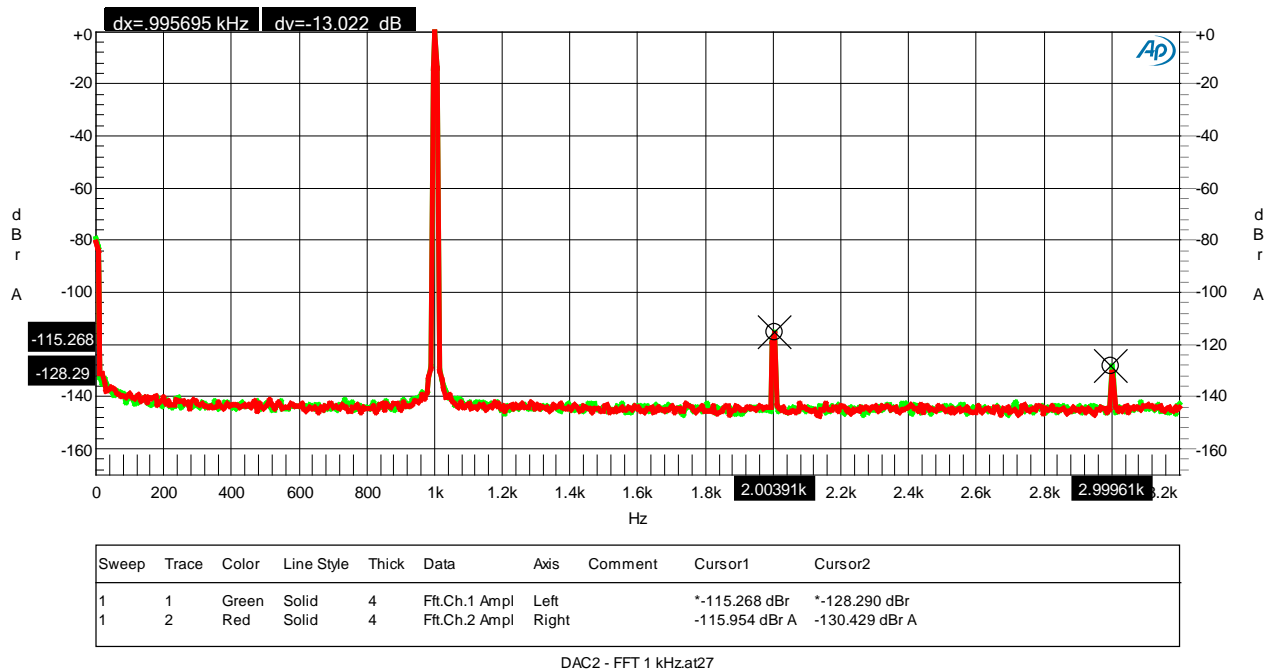

Graph 3 - FFT 10 kHz

The 10 kHz FFT analysis is an excellent test for detecting sample clock jitter. Jitter will create sidebands (unwanted tones) above and below the 10 kHz test tone. A jitter frequency of 1 kHz would create two sideband tones; a lower sideband at 9 kHz, and an upper sideband at 11 kHz. Similarly, a jitter frequency of 2 kHz would produce sideband tones at 8 kHz and 12 kHz. The above plot shows no evidence of jitter-induced sidebands to a measurement limit of about -140 dBFS.

The -140 dB measurement limit is due to the SNR limitations of the Audio Precision 2700 test set, and not the **DAC2**. Note the very low harmonic distortion; -114 to -116 dB 2nd harmonic (20 kHz), and -120 to -122 dB 3rd harmonic (30 kHz). Please note that these are almost exactly the same harmonic distortion levels that occur with a 1 kHz tone (see **Graph 4 - FFT 1 kHz**). This demonstrates that the **DAC2** analog stages have the high slew rates required to pass high-amplitude high-frequency signals without an increase in harmonic distortion.

The rise at 0 Hz is normal in an FFT analysis and is not an indication of noise. This 32k point FFT analysis uses a Blackman-Harris window with 16x power averaging, and spans a frequency range of DC to 32 kHz.

Graph 4 - FFT 1 kHz

The 1 kHz FFT analysis demonstrates the low harmonic distortion of the **DAC2**. Second harmonic distortion (2 kHz) measures about -115 dB, while 3rd harmonic distortion measures -128 to -130 dB.

The rise at 0 Hz is normal in an FFT analysis and is not an indication of noise. This 32k point FFT analysis uses a Blackman-Harris window with 16x power averaging, and spans a frequency range of DC to 32 kHz.

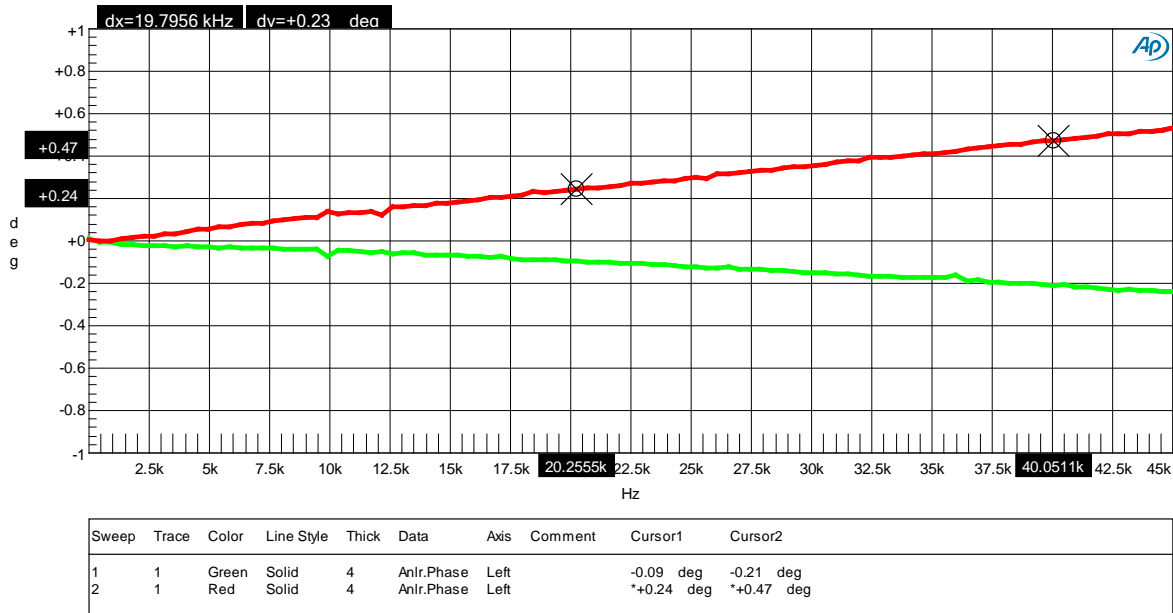

Sweep	Trace	Color	Line Style	Thick	Data	Axis	Comment	Cursor1	Cursor2

DAC2 - Frequency Response.at27

Graph 5 - Frequency Response

This plot demonstrates the ruler-flat frequency response of the **DAC2**. Note that the frequency response measures -0.01 dB at 10 Hz and -0.02 dB at 40 kHz.

DAC2 - Differential Phase.at27

Graph 6 - Differential Phase

This plot demonstrates the inter-channel phase accuracy of the **DAC2**. From this plot, the inter-channel phase accuracy is calculated to be +/- 0.17 degrees at 20 kHz, and +/- 0.34 degrees at 40 kHz.

The phase accuracy of the **DAC2** is almost the same as the phase accuracy of the Audio Precision 2700 test set. For this reason, the phase error in the AP must be subtracted from the measurement. The green trace assigns the left channel to channel 1 of the AP, and the right channel to channel 2 of the AP. The red trace reverses the inputs. The two traces must be averaged to remove the phase errors of the AP test set.

DAC2 converters are phase-accurate between boxes. Three **DAC2** converters can be used as a group to form a phase-accurate 5.1 surround system. Four **DAC2** converters can be combined to form a 7.1 system. The phase accuracy between any two channels will match the phase accuracy shown above.

Graph 7 - Balanced THD+N vs. Amplitude

This plot demonstrates the very low harmonic distortion produced by the **DAC2** at signal levels ranging from -14 dBFS to 0 dBFS. All variations below -4 dBFS are due to the measurement limits of the AP 2700 system. The peaks at -13 dBFS are due to an AP 2700 gain range change. In almost all listening environments, THD will be below the threshold of hearing. The **DAC2** is virtually uncolored by any trace of harmonic distortion.

The **DAC2** includes differential amplifiers that remove common-mode distortion components. This is important, because common-mode distortion is not detected when measuring with the precisely-balanced inputs on the AP 2700 test set. The THD+N measurements on the unbalanced outputs confirm the effectiveness of the differential amplifiers. Similar results are obtained by measuring either side of the balanced outputs relative to ground.

Graph 8 - Unbalanced THD+N versus Amplitude

This plot shows the THD+N performance of the unbalanced outputs. Note that the THD+N performance of the unbalanced outputs approaches that of the balanced outputs. The **DAC2** includes differential amplifiers that remove common-mode THD from the balanced outputs of the SABRE converters. These differential amplifiers give the unbalanced outputs the ability to approach the performance of the balanced outputs. Please note that the differential amplifiers also eliminate common-mode distortion on the balanced outputs.

Graph 9 - Headphone Amplifier – THD+N versus Amplitude (DAC2 HGC model only)

This plot shows the THD+N performance of the headphone outputs under load. Note that the THD+N performance of the headphone outputs approaches that of the balanced outputs. The **DAC2** includes Benchmark's **HPA2™** headphone amplifier. The **HPA2™** has a near 0-Ohm output impedance which provides outstanding control and damping of the headphone drivers. The **HPA2™** has the voltage and current drive necessary to drive a wide variety of headphones.

DAC2 - THD+N VS FREQ AT 0 dBFS (w/80 kHz LPF unweighted)
Balanced Outputs

Graph 10 - THD+N vs. Frequency 80 kHz

The analog output stages on the **DAC2** have high slew rates and are capable of maintaining low THD levels at high frequencies even when driven to 0 dBFS. Note that there is almost no rise in THD+N with frequency, even when operating at maximum output levels.

Sweep	Trace	Color	Line Style	Thick	Data	Axis	Comment	Cursor1	Cursor2

DAC2 - JITTER TOLERANCE.at27

Graph 14 - Jitter Tolerance

The Audio Engineering Society (AES) has created a jitter tolerance template for testing digital audio devices. The red curve shows the AES jitter tolerance template. Induced jitter approaches 5 UI at 200 Hz, and is reduced to 0.125 UI above 8 kHz. The green trace shows the THD+N of the **DAC2** while being driven with the jitter shown on the red curve. Over the entire range of the AES jitter tolerance test, the THD+N performance of the **DAC2** is unchanged. The **DAC2** easily passes the AES jitter tolerance test without any THD+N performance degradation.

DAC2 - INTERFACE JITTER TOLERANCE FFT

DAC2 - JITTER TOLERANCE FFT.at27

Graph 15 - Jitter Tolerance FFT

This figure shows a series of FFTs that were acquired while running the AES jitter tolerance test. Note that none of the 31 FFTs show any signs of jitter-induced sidebands. Note that the plots are identical to the plots shown in **Graph 4 - FFT 1 kHz**. The **DAC2** shows no change in performance when the AES jitter tolerance test is applied to the digital inputs. No jitter-induced sidebands are visible to a measurement limit that exceeds -140 dBFS.

Graph 16 - IMD 11k 12K

This plot demonstrates that the **DAC2** has very low IMD distortion. The 1 kHz difference frequency measures -122 dB, and the 10 kHz and 13 kHz products measure about -128 dB. IMD distortion should be well below audible levels.

Specifications

Audio Performance	
<i>F_s = 44.1 to 96 kHz, 20 to 20 kHz BW, 1 kHz test tone, 0 dBFS = +24 dBu (unless noted)</i>	
SNR – A-Weighted, 0 dBFS = +20 to +29 dBu	126 dB
SNR – Unweighted, 0 dBFS = +20 to +29 dBu	123 dB
THD+N, 1 kHz at 0 dBFS	-109 dBFS, -109 dB, 0.00035%
THD+N, 1 kHz at -1 dBFS	-110 dBFS, -109 dB, 0.00035%
THD+N, 1 kHz at -3 dBFS	-113 dBFS, -109 dB, 0.00035%
THD+N, 20 to 20 kHz test tone at -3 dBFS	-112 dBFS, -108 dB, 0.00040%
Frequency Response at F _s =96 kHz	+0 dB, -0.04 dB (20 to 20 kHz) -0.04 dB at 10 Hz -0.04 dB at 20 kHz -0.04 dB at 40 kHz -0.7 dB at 45 kHz
Frequency Response at F _s =48 kHz	+0 dB, -0.04 dB (20 to 20 kHz) -0.04 dB at 10 Hz -0.04 dB at 20 kHz
Crosstalk	-116 dB at 20 kHz -130 dB at 1 kHz -137 dB at 20 Hz
Maximum Amplitude of Jitter Induced Sidebands (10 kHz 0 dBFS test tone, 12.75 UI sinusoidal jitter at 1 kHz)	< -144 dB
Maximum Amplitude of Spurious Tones with 0 dBFS test signal	< -138 dB
Maximum Amplitude of Idle Tones	< -147 dB
Maximum Amplitude of AC line related Hum & Noise	< -140 dB
Inter-channel Differential Phase (Stereo Pair – any sample rate)	+/- 0.25 degrees at 20 kHz
Inter-channel Differential Phase (Between DAC2 Units F _s <110 kHz) Any sample rate.	+/- 0.25 degrees at 20 kHz
Maximum Lock Time after F _s change	400 ms
Soft Mute Ramp Up/Down Time	50 ms
Mute on Receive Error	Yes
Mute on Lock Error	Yes
Mute on Idle Channel	No
50/15 us De-Emphasis Enable	Automatic in Consumer Mode
De-Emphasis Method	Digital IIR
De-Emphasis Supported at	F _s = 32, 44.1, 48 kHz

Group Delay (Latency)	
Delay – Digital Input to Analog Output (function of sample rate)	1.36 ms at 44.1 kHz 1.27 ms at 48 kHz 0.90 ms at 88.2 kHz 0.82 ms at 96 kHz 0.51 ms at 176.4 kHz 0.47 ms at 192 kHz

Digital Audio Inputs	
Number of Digital Inputs (switch selected)	5 (1 USB, 2 Optical, 2 Coaxial)
Number of Channels	2
Input Sample Frequency Range	28 to 210 kHz (Coaxial Inputs) 28 to 96 kHz (Optical Inputs) 44.1, 48, 88.2, 96, 176.4, 192 kHz (USB Input)
Maximum Input Word Length	24 bits
Digital Input Impedance	75 Ohms (Coaxial Inputs)
DC Blocking Capacitors on Digital Inputs	Yes (Coaxial Inputs)
Transient and Over-Voltage Protection on Digital Inputs	Yes (Coaxial Inputs)
Minimum Digital Input Level	250 mVpp (Coaxial Inputs)

Jitter Tolerance	
(With no Measurable Change in Performance)	>12.75 UI sine, 100 Hz to 3 kHz >1.5 UI sine at 20 kHz >1.5 UI sine at 40 kHz >1.5 UI sine at 80 kHz >1.5 UI sine at 90 kHz >0.25 UI sine above 160 kHz
Jitter Attenuation Method	Benchmark UltraLock2™ - all inputs

Balanced Analog Outputs	
Number of Balanced Analog Outputs	2
Output Connector	Gold-Pin Neutrik™ male XLR
Output Impedance	60 Ohms (Attenuator off) 425 Ohms (Attenuator = 10 dB) 135 Ohms (Attenuator = 20 dB)
Analog Output Clip Point	+29 dBu
Factory Set Bypass Level (at 0 dBFS)	+24 dBu (Attenuator = 0 dB)
Output Level Range (at 0 dBFS) In 'Variable' Mode	Off to +24 dBu (Attenuator off) Off to +14 dBu (Attenuator = 10 dB) Off to +4 dBu (Attenuator = 20 dB)
Output Level Variation with Sample Rate (44.1 kHz vs. 96 kHz)	< +/- 0.006 dB

Unbalanced Analog Outputs	
Number of Unbalanced Analog Outputs	4
Output Connector	RCA
Output Impedance	30 Ohms
Analog Output Clip Point	+13.5 dBu (3.7 Vrms)
Factory Set Home Theater Bypass Output Level (at 0 dBFS)	+8.2 dBu (2 Vrms)
Output Level Range (at 0 dBFS)	Off to +8.2 dBu (2 Vrms)
Output Level Variation with Sample Rate (44.1 kHz vs. 96 kHz)	< +/- 0.006 dB

HPA2™ Headphone Outputs	
Number of Headphone Outputs	2
Output Connectors	¼" TRS with switch on left-hand jack
Output Impedance	< 0.11 Ohms
Output Level Control	Stereo Control on Front Panel
Output Level Range (at 0 dBFS) into 60-Ohm Load	Off to +18 dBu
Maximum Output Current	250 mA
Overload Protection (independent per channel)	Current limited at 300 mA, Thermal
Bandwidth	> 500 kHz
THD+N	-106 dB, 0.0005% into 30 Ohms at +18 dBu (1.26W into 30 Ohms)

Unbalanced Analog Inputs	
Number of Unbalanced Analog Inputs	4
Input Connector	RCA
Input Impedance	20 K Ohms
Analog Input Clip Point	+18.5 dBu (6.5 Vrms)
Input Sensitivity	+8.2 dBu (2 Vrms)

Status Display	
Indicators - Type and Location	16 LED's on Front Panel
Selection/Status Indication	1 – Dim/Mute 1 - Polarity 7 – Input 1 – Bypass/Calibrated Output 2 – Word length 4 – Sample Rate

AC Power Requirements	
Nominal Input Operating Voltage Range (VAC RMS)	100 – 240V
Frequency	50-60 Hz
Power	< 0.5 Watts Idle 12 Watts Typical Program 15 Watts Maximum
Fuses	5 x 20 mm (2 required) 0.5 A 250 V Slo-Blo® Type
Min/Max Operating range (VAC RMS)	90 – 260 47 – 63Hz

Dimensions	
Form Factor	½ Rack Wide, 1 RU High
Depth behind front panel	8.5" (216 mm)
Overall depth including connectors but without power cord	9.33" (237 mm)
Width	9.5" (249 mm)
Height	1.725" (44.5 mm)

Weight	
DAC2 only	3 lb.
DAC2 with accessories and manual	4 lb.
Shipping weight	7 lb.

Regulatory Compliance

FCC and RoHS Compliance Statements

FCC Notice (U.S. Only)

NOTICE: This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

This device complies with Part 15 of the FCC rules. Operation is subject to the following two conditions:

1. This device may not cause harmful interference.
2. This device must accept any interference received including interference that may cause undesired operation.

Instructions to Users: This equipment complies with the requirements of FCC (Federal Communication Commission) equipment provided that following conditions are met:

- RCA Digital Connections: Shielded 75-Ohm coaxial cable must be used.

NOTICE: Changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

RoHS Compliant Information

This statement clarifies Benchmark Media Systems, Inc. product compliance with the EU's (European Union) directive 2002/95/EC, or, *RoHS* (Restrictions of Hazardous Substances).

As of July 01, 2006, All Benchmark Media Systems, Inc. products placed on the European Union market are *compliant* (containing quantity limit weight less than or equal to 0.1% (1000 ppm) of any homogeneous Lead (Pb), Mercury (Hg), Hexavalent Chromium (Cr VI), and flame retardant Polybrominated Biphenyls (PBB) or Polybrominated Diphenyl Ethers (PBDE)).

CE Certificates of Conformity

Certificate of Conformity

Diversified T.E.S.T. Technologies, Inc. has tested the product to the current appropriate standards and finds that the product is in compliance with those requirements.

EMC Directive:	2004/108/EC
Generic Emissions Standard:	EN 61000-6-3: 2007/A1:2011
Product Specific Emissions:	EN 55011 Class A
Generic Immunity Standard:	EN 61000-6-1: 2007
Immunity:	EN 61000-4-2 Electrostatic Discharge
	EN 61000-4-3 Radiated Susceptibility
	EN 61000-4-6 Conducted Susceptibility

Manufacturer's Name:	Benchmark Media Systems
Manufacturer's Address:	203 East Hampton Suite 2 Syracuse, NY 13206
Product:	DAC2HGC
Model Number:	500-14800-XXX *

* Where XXX indicates a color code.

This Certificate of Compliance issued September 21, 2012 is valid for the test sample of the product specified above and that it conforms to the Directive(s) and Standard(s).

Warranty Information

Benchmark 1-Year Warranty

The Benchmark 1-Year Warranty

Benchmark Media Systems, Inc. warrants its products to be free from defects in material and workmanship under normal use and service for a period **of one year from the date of delivery.**

This warranty extends only to the original purchaser. This warranty does not apply to fuses, lamps, batteries, or any products or parts that have been subjected to misuse, neglect, accident, modification, or abnormal operating conditions.

In the event of failure of a product under this warranty, Benchmark Media Systems, Inc. will repair, at no charge, the product returned to its factory. Benchmark Media Systems, Inc. may, at its option, replace the product in lieu of repair. If the failure has been caused by misuse, neglect, accident, or, abnormal operating conditions, repairs will be billed at the normal shop rate. In such cases, an estimate will be submitted before work is started, if requested by the customer.

Attempts to deliberately deface, mutilate, or remove the product's label will render this warranty void. Benchmark will not honor warranties for any products disingenuously purchased on the US or Canadian markets for export.

The foregoing warranty is in lieu of all other warranties, expressed or implied, including but not limited to any implied warranty of merchantability, fitness or adequacy for any particular purpose or use. Benchmark Media Systems, Inc. shall not be liable for any special, incidental, or consequential damages, and reserves the right to change this information without notice. This limited warranty gives the consumer-owner specific legal rights, and there may also be other rights that vary from state to state.

Benchmark Extended Warranty Options

The Benchmark Extended 5-Year Warranty *

Benchmark Media Systems, Inc. optionally extends the standard 1-year warranty to a period of **five years from the date of delivery**.

*For the extended warranty to become effective, the original purchaser must register the product at the time of purchase either by way of the enclosed registration card or through the product registration section of the Benchmark Media Systems, Inc. website. This optional warranty applies only to products purchased within the US and Canada and is extended only to the original purchaser.

Attempts to deliberately deface, mutilate, or remove the product's label will render this warranty void. Benchmark will not honor warranties for any products disingenuously purchased on the US or Canadian markets for export. The terms of the extended warranty are subject to change without notice. For products purchased outside the US and Canada, please refer to the Extended Two 2-Year International Warranty.

The Benchmark Extended 2-Year International Warranty **

Benchmark Media Systems, Inc. optionally extends the standard 1-year warranty to a period of **two years from the date of delivery**.

**For the extended warranty to become effective, the original purchaser must register the product at the time of purchase either by way of the enclosed registration card or through the product registration section of the Benchmark Media Systems, Inc. website. This optional warranty applies only to products purchased outside the US and Canada and is extended only to the original purchaser.

Attempts to deliberately deface, mutilate, or remove the product's label will render this warranty void. Benchmark will not honor warranties for any products disingenuously purchased on the US or Canadian markets for export. The terms of the extended warranty are subject to change without notice. For products purchased in within the US and Canada, please refer to the Extended Five 5-Year Warranty.

Notes on Warranty Repairs

An RMA (return merchandise authorization) number, issued by our Customer Service Department, is required when sending products for repair.

They must be shipped to Benchmark Media Systems prepaid and preferably in their original shipping carton with the RMA number clearly visible on the exterior of the packaging. A letter should be included giving full details of the difficulty.
