Comparison between electrochemistry DO sensor and optical DO sensor

	Polarography or galvanic DO sensor	Optical DO sensor	
Measurement	Consume oxygen in measurement – Unstable measurements.	Adopts Fluorescence technologies, no oxygen being consumed during test – stable measurements	
Calibration	Serious electrode polarization , frequent calibration is needed; calibration time is long	No polarization; no need to calibrate frequently; only 2 minutes to calibrate.	
Performance	Slow response, bad repeatability, low accuracy	15 seconds response time, good repeatability, high accuracy.	
Lifetime	electrode membrane need to be frequently replaced; electrolyte need to be refilled; short life time.	No electrode membrane; no electrolyte; Service life>8000hours
