

FOR BEST RESULTS BURNING YOUR FIREWOOD:

- Stack your wood as soon as possible – stacking **seasoned wood outdoors** in the sun is best. **DO NOT** stack in a cold garage or shed because you want air circulation to speed up the drying out of the wood.
- Always stack **kiln dried firewood INSIDE** for best results.
- Avoid stacking wood in contact with the ground
- Cover the top of the stack, leaving the sides open for air circulation
- Locate the stack facing the sun
- Measure your stack to verify that your cord is 128 cubic feet – Wolf Hill guarantees a full cord!
- Have a rotation process going: Bring a week's supply of wood into your home and store next to your fireplace or wood burning stove. The heat from these burning sources will pull the moisture out of the firewood. Refill the supply as needed and you will have burnable wood regardless of the weather!

STARTING YOUR FIRE:

- Even with the best firewood, you must use the proper techniques to start your fire. Begin with an ample supply of kindling wood. Ignite a few pieces of crumpled newspaper. When the kindling is burning well, add several pieces of firewood and wait until a bed of embers is created. Only when the small firewood has begun to burn well, should you add full-sized firewood.
- Wolf Hill carries Fatwood and fire starters that can help you get your fire started faster!

*****DID YOU KNOW:**

- Firewood will burn only when the temperature of the wood reaches 600 degrees Fahrenheit. Attempts to burn a cold log without using a form of kindling other than paper will be unsuccessful.
- Wolf Hill has **ALL** of your fireplace accessories! Chimenea's, fireplace screens, mats, tools, matches, log holders & carriers, kindling, fatwood, fire starters, tarps... just to name a few!
