Welcome to BMW

We congratulate you on your choice of a vehicle from BMW Motorrad and welcome you to the community of BMW riders. Familiarise yourself with your new vehicle so that you can ride it safety and confidently in all traffic situations.

About this Rider's Manual

Please read this Rider's Manual carefully before starting to use your new BMW. It contains important information on how to operate the controls and how to make the best possible use of all your BMW's technical features. In addition, it contains information on maintenance and care to help you maintain your vehicle's reliability and safety, as well as its value.

Suggestions and criticism

If you have questions concerning your motorcycle, your authorised BMW Motorrad dealer will gladly provide advice and assistance.

We hope you will enjoy riding your BMW and that all your journeys will be pleasant and safe.

BMW Motorrad.

Actuality ......................... 7
Overview
Chapter 2 of this Rider's Manual will provide you with an initial overview of your motorcycle. All maintenance and repair work on the motorcycle is documented in Chapter 12. This record of the maintenance work you have performed on your vehicle is a precondition for generous treatment of goodwill claims.

When the time comes to sell your BMW, please remember to hand over this Rider’s Manual; it is an important part of the motorcycle.

Abbreviations and symbols

Indicates warnings that you must comply with for reasons of your safety and the safety of others, and to protect your product against damage.

Specific instructions on how to operate, control, adjust or look after items of equipment on the motorcycle.

- Indicates the end of an item of information.
- Instruction.
- Result of an activity.
- Reference to a page with more detailed information.

Indicates the end of a passage relating to specific accessories or items of equipment.

Tightening torque.

Technical data.

OE Optional extras.

The vehicles are assembled complete with all the BMW Motorrad optional extras originally ordered.

OA Optional accessories.

You can obtain BMW Motorrad optional accessories through your authorised BMW Motorrad dealer; optional accessories have to be retrofitted to the vehicle.

EWS Electronic immobiliser.

DWA Anti-theft alarm (Diebstahlwarnanlage).

ABS Anti-lock brake system.

DTC Dynamic Traction Control.
DDC  Dynamic Damping Control.

Equipment
When you ordered your BMW motorcycle, you chose various items of custom equipment. This Rider’s Manual describes optional extras (OE) offered by BMW and selected optional accessories (OA). This explains why the manual may also contain descriptions of equipment which you have not ordered. Please note, too, that your motorcycle might not be exactly as illustrated in this manual on account of country-specific differences. If your BMW was supplied with equipment not described in this Rider’s Manual, you will find these features described in separate manuals.

Technical data
All dimensions, weights and power ratings stated in the Rider’s Manual are quoted to the standards and comply with the tolerance requirements of the Deutsches Institut für Normung e.V. (DIN). Versions for individual countries may differ.

Actuality
The high safety and quality standards of BMW motorcycles are maintained by constant development work on designs, equipment and accessories. Because of this, your motorcycle may differ from the information supplied in the Rider’s Manual. Nor can BMW Motorrad entirely rule out errors and omissions. We hope you will appreciate that no claims can be entertained on the basis of the data, illustrations or descriptions in this manual.

See Section 5 for information on the display modes for the race track.
Warning and telltale lights

1. DTC warning light (⇒ 30)
2. ABS warning light (⇒ 29)
3. Telltale light for left turn indicators
4. General warning light, in combination with warnings in the display (⇒ 23)
5. Telltale light for right turn indicators
6. Warning light for fuel down to reserve (⇒ 27)
7. Telltale light for neutral
8. High-beam headlight telltale light
9. Warning light for engine electronics (⇒ 27)
10. "Fastest lap" light (⇒ 81)
During the Pre-Ride-Check, the availability of the ABS Pro function is indicated by "ABS Pro" showing in the multifunction display.

Service-due indicator

1. The service-due date shows when a service is due within one month.

2. When a service is due within 1000 km (700 miles), the countdown distance is shown and counted down in steps of 100 km (100 miles). This reading appears briefly after the Pre-Ride-Check completes.

- If service is overdue, the due date or the odometer reading at which service was due is accompanied by the 'General' warning light showing yellow. The word "Service" remains permanently visible.

- If the service-due indicator appears more than a month before the service date, the date saved in the instrument cluster must be adjusted. This situation can occur if the battery was disconnected for a prolonged period of time.

If you want to have the date set consult a specialist workshop, preferably an authorised BMW Motorrad dealer.
The range readout 1 indicates how far you can ride with the fuel remaining in the tank. This reading is not displayed until fuel level has dropped to reserve. This distance is calculated on the basis of fuel level and average consumption. When refuelling after running on reserve, make sure that you top up the tank to a level above reserve, as otherwise the sensor will not be able to register the new level. If the sensor cannot register the new level the range readout cannot be updated.

When the motorcycle is propped on its side stand the slight angle of inclination means that the sensor cannot register the fuel level correctly. This is the reason why the range is calculated only when the side stand is in the retracted position.

The calculated range is only an approximate figure. Consequently, BMW Motorrad recommends that you should not try to use the full range before refuelling.

**Warnings**

**Mode of presentation**

Warnings are indicated by the corresponding warning lights. Warnings for which there is no dedicated warning light are indicated by 'General' warning light 1 showing in combination with a warning such as, for example, 2 appearing on the multifunction display. The 'general' warning light shows red or yellow, depending on the urgency of the warning.

If two or more warnings occur at the same time, all the appropriate warning lights and warning symbols appear, alternating with warning words as applicable. The possible warnings are listed on the next pages.

</table>
Electronic immobiliser active

⚠ General warning light shows yellow.

! EWS appears on the display. Possible cause:
The key being used is not authorised for starting, or communication between key and engine electronics is disrupted.
- Remove all other vehicle keys from the same ring as the ignition key.
- Use the reserve key.
- Have the defective key replaced, preferably by an authorised BMW Motorrad dealer.

Fuel down to reserve

⚠ Warning light for fuel down to reserve shows.

⚠ Lack of fuel can cause the engine to run irregularly or die (risk of accident) and result in damage to the catalytic converter.

Do not run the fuel tank dry.

Possible cause:
The fuel tank contains no more than the reserve quantity of fuel.

- Reserve fuel

approx. 4 l

- Refuelling (72).

Coolant temperature too high

⚠ General warning light shows red.

The coolant-temperature reading flashes.

⚠ Riding when the engine is overheated could result in engine damage.

Compliance with the information set out below is essential.

Possible cause:
The coolant temperature is too high.
- If possible, ride in the part-load range to cool down the engine.
- If the coolant temperature is frequently too high, have the fault rectified as soon as possible by a specialist workshop, preferably an authorised BMW Motorrad dealer.

Engine in emergency-operation mode

⚠ Warning light for engine fault shows.

⚠ The engine is running in emergency operating mode. Unusual engine response is a possibility.

Adapt your style of riding accordingly. Avoid accelerating sharply and overtaking.

Refuelling (72)
Possible cause:
The engine control unit has diagnosed a fault. The engine is in emergency-operation mode. In exceptional cases, the engine stops and refuses to start.
- You can continue to ride, but bear in mind that the usual engine power or the full range of engine rpm might not be available.
- Have the fault rectified as quickly as possible by a specialist workshop, preferably an authorised BMW Motorrad dealer.

**Bulb for rear light faulty**

- General warning light shows yellow.
  - ! LAMPR appears on the display.
  - A bulb failure on the motorcycle is a safety risk, because it is easier for other road users to overlook the vehicle. Always replace a faulty bulb at the earliest possible opportunity.

Possible cause:
Bulb for rear light or brake light faulty
  - The LED rear light must be replaced. Consult a specialist workshop, preferably an authorised BMW Motorrad dealer.

**Bulb for parking light defective**

  - ! LAMPF appears on the display.
  - A bulb failure on the motorcycle is a safety risk, because it is easy for other road users to overlook the vehicle. Replace defective bulbs as soon as possible; always carry a complete set of spare bulbs if possible.

Possible cause:
Bulb for parking light defective
  - Replacing bulb for left parking light (154).
  - Replacing bulb for right side light (156).

**Bulb for turn indicator defective**

  - ! LAMP appears on the display.
  - A bulb failure on the motorcycle is a safety risk, because it is easy for other road users to overlook the vehicle. Replace defective bulbs as soon as possible; always carry a complete set of spare bulbs if possible.

Possible cause:
Bulb for turn indicator defective
  - Replacing bulbs for front and rear turn indicators (157).
Possible cause:
The number-plate carrier has been removed; the motorcycle’s on-board electronics know that the flashing turn indicators are not installed on the motorcycle.
• Installing number-plate carrier (108).
• In SETUP mode, switch on suppression of the error message.

Motorcycle dropped
! VDS (Vertical Down Sensor) appears on the blank display.
Possible cause:
The drop sensor has detected a drop and has cut out the engine.
• Bring the motorcycle to the upright position
• Switch the ignition off and then on again or switch the kill switch on and then off again.

Drop sensor defective
! VDS (Vertical Down Sensor) appears on the display.
Possible cause:
A defect in the drop sensor has been detected.
• Seek the advice of a specialist workshop, preferably an authorised BMW Motorrad dealer.

ABS self-diagnosis not completed
ABS warning light flashes.
Possible cause:
The ABS function is not available, because self-diagnosis did not complete. The motorcycle has to move forward a few metres for the wheel-speed sensors to be tested.
• Pull away slowly.
  » Self-diagnosis is in progress.
  » The ABS function is available when self-diagnosis completes.

ABS deactivated
ABS warning light flashes.
Possible cause:
The rider has switched off the ABS system.
• Activating the ABS function (44).

ABS fault
ABS warning light flashes.
Possible cause:
The ABS control unit has detected a fault. The ABS function is not available.
• You can continue to ride the vehicle, but make due provision for the fact that the ABS function is not available. Bear in mind the more detailed information on situations that can lead to an ABS fault (118).
• Have the fault rectified as quickly as possible by a
specialist workshop, preferably an authorised BMW Motorrad dealer.

**DTC intervention**
DTC warning light quickly flashes.
The DTC has detected a degree of instability at the rear wheel and has intervened to reduce torque. The warning light flashes for longer than DTC intervention lasts. This affords the rider visual feedback on control intervention even after the critical situation has been dealt with.

**DTC self-diagnosis not completed**
DTC warning light slowly flashes.
Possible cause:
Self-diagnosis did not complete, so the DTC function is not available. The motorcycle must reach a speed of at least 5 km/h with the engine running in order for DTC self-diagnosis to complete.
- Pull away slowly.
- Self-diagnosis is in progress.
- The DTC function is available when self-diagnosis completes.

**DTC switched off**
DTC warning light shows.
Possible cause:
The rider has switched off the DTC system.
- Switch on the DTC function (⇒ 45).

**DTC fault**
DTC warning light shows.
Possible cause:
The DTC control unit has detected a fault.
- You can continue to ride. Bear in mind that the DTC function is not available or the functionality might be subject to certain restrictions. Bear in mind the more detailed information on situations that can lead to a DTC fault (⇒ 120).
- Have the fault rectified as quickly as possible by a specialist workshop, preferably an authorised BMW Motorrad dealer.

**DDC fault**
General warning light shows yellow.
! DDC appears on the display.
Possible cause:
The DDC control unit has detected a fault.
- Have the fault rectified as quickly as possible by a specialist workshop, preferably an authorised BMW Motorrad dealer.
- In this condition, the motorcycle has too much damping
and is uncomfortable to drive, especially on roads in poor condition.

**Anti-theft alarm battery weak**
- with anti-theft alarm (DWA) OE

! DWA LO appears on the display.

This error message shows briefly only after the Pre-Ride-Check completes.

Possible cause:
The integral battery in the anti-theft alarm has lost a significant proportion of its original capacity. There is no assurance of how long the anti-theft alarm can remain operational if the vehicle's battery is disconnected.

- Seek the advice of a specialist workshop, preferably an authorised BMW Motorrad dealer.

**Anti-theft alarm battery flat**
- with anti-theft alarm (DWA) OE

General warning light shows yellow.

! DWA appears on the display.

This error message shows briefly only after the Pre-Ride-Check completes.

Possible cause:
The integral battery in the anti-theft alarm has lost its entire original capacity. There is no assurance that the anti-theft alarm will be operational if the vehicle's battery is disconnected.

- Seek the advice of a specialist workshop, preferably an authorised BMW Motorrad dealer.

**Speed warning**

Shift indicator lights up or flashes, depending on your preferred setting.

! SPEED appears on the display.

Possible cause:
The preset top speed was exceeded.

- Reduce speed.
- Set a new top speed.

Keys
You receive 2 ignition keys. Please consult the information on the electronic immobiliser (EWS) if an ignition key is lost or mislaid (⇒ 35).

Switching on ignition

1. Turn the ignition key to position 1.
2. Parking lights and all function circuits switched on.
3. Engine can be started.

- Pre-Ride-Check is performed. (⇒ 64)
- ABS self-diagnosis is in progress. (⇒ 65)
- DTC self-diagnosis is in progress. (⇒ 65)

Switching off ignition

1. Turn the ignition key to position 2.
2. Lights switched off.
3. Handlebars not locked.
4. Ignition key can be removed.

Lock the handlebars
- Turn the handlebars all the way to left.

1. Turn the ignition key to position 3, while moving the handlebars slightly.
2. Ignition, lights and all function circuits switched off.
3. Handlebars locked.
4. Ignition key can be removed.
Electronic immobiliser EWS

The electronic design of the motorcycle allows it to access data stored in the ignition key by means of a ring antenna located in the ignition switch. The ignition is not enabled for starting until the engine control unit has recognised the key as "authorised" for your motorcycle.

If you lose your key, you can have it barred by your BMW Motorrad authorised dealer. If you wish to do this, you will need to bring all other keys for the motorcycle with you. The engine cannot be started by a barred key, but a key that has been barred can subsequently be reactivated.

You can obtain replacement/extra keys only through an authorised BMW Motorrad dealer. The keys are part of an integrated security system, so the dealer is under an obligation to check the legitimacy of all applications for replacement/extra keys.

A spare key attached to the same ring as the ignition key used to start the engine could "imitate" the electronics, in which case the enabling signal for starting is not issued. The ! EWS warning appears in the multifunction display. Always keep the spare key separately from the ignition key.

Anti-theft alarm

Activation

- with anti-theft alarm (DWA) OE

- Switching on ignition (⇒ 34).
- DWA adjusting (⇒ 36).
- Switch off the ignition.
- DWA If the alarm system (DWA) is activated, then the alarm system will be armed automatically when the ignition is switched off.
- Activation takes approximately 30 seconds to complete.
- Turn indicators flash twice.
- Confirmation tone sounds twice (if programmed).
- Anti-theft alarm (DWA) is active.
Alarm signal

The alarm signal continues for 26 seconds. The system is active again another 12 seconds later. You can interrupt an alarm signal at any time by pressing button 1 on the remote control. This function does not change the status of the anti-theft alarm. While an alarm is in progress an acoustic alarm signal sounds and the turn indicators flash. You can program the type of alarm signal.

Deactivation
- with anti-theft alarm (DWA) OE
  - Kill switch in operating position (run).
  - Switch on the ignition.
  - Turn indicators flash once.
  - Confirmation tone sounds once (if programmed).
  - Anti-theft alarm (DWA) is deactivated.

DWA adjusting
- with anti-theft alarm (DWA) OE
  - Switching on ignition (34).

Operation

Deactivation
- with anti-theft alarm (DWA) OE

DWA adjusting
- with anti-theft alarm (DWA) OE

If you scroll down too far, repeatedly short-press SET 2 until SETUP MENU ENTER 3 appears on the display.

- Long-press SET 2 to open the menu.
Repeatedly short-press SET 2 until SETUP EQUIPMENT ENTER 4 appears on the display.

If you scroll down too far, short-press TRIP 1 to scroll back up.

Long-press SET 2 to open the menu.

The DWA AUTO parameter 5 and its current value 6 appear on the display.

Long-press SET 2 to change the value of setting 6.

Value 6 flashes.

Short-press TRIP 1 or SET 2 to change the value.

The following settings are available:

- DWA AUTO ON: the DWA anti-theft alarm is active and will be armed automatically when the ignition is switched off.
- DWA AUTO OFF: the DWA anti-theft alarm is deactivated.

Long-press SET 2 to save the new value.

» Value 6 stops flashing.
» This completes the process.
» Long-press TRIP 1 to abort the procedure.
» Adjustment aborted.

Clock
Setting the clock

Attempting to set the clock while riding the motorcycle can lead to accidents. Set the clock only when the motorcycle is stationary.

Switch on the ignition.

Operation
Press and hold down button 2 until the hours number 3 flashes.
- Press button 1 to step the hours reading up.
- Press button 2 to step the hours reading down.
- When the hours reading is correct, hold down button 2 until minutes reading 4 flashes.
- Press button 1 to step the minutes reading up.
- Press button 2 to step the minutes reading down.
- When the minutes reading is correct, press and hold down button 2 until the number stops flashing.
- This completes the process.

**Odometer**

**Selecting the display**
- Switch on the ignition.

The following values can be displayed:
- Total distance
- Tripmeter reading 1 (Trip 1)
- Tripmeter reading 2 (Trip 2)
- Range (once fuel level is down to reserve)

**Resetting tripmeter**
- Switch on the ignition.
- Select a tripmeter.

**Operation**

- Press and hold down button 1 until the tripmeter reading is reset.

**Speed warning**

**Adjusting speed warning**
- If applicable, activate the speed warning in the SETUP menu (see "On the race track").
Repeatedly press button 2 until LIMIT appears on the display.

The current speed setting or OFF appears on the display.

To set the current speed as the new limit: Hold down button 2 until this speed appears on the display.

To increase the speed setting: Briefly press button 1. Speed is increased by approx. 10 km/h each time you press the button.

If you exceed the limit set beforehand, shift indicator 3 lights up or flashes at the preset frequency and warning 4 appears on the display.
To switch off the speed warning: Hold down button 1 until OFF appears on the display.

**Lights**

**Side light**
The side lights switch on automatically when the ignition is switched on.

- The side lights place a strain on the battery. Do not switch the ignition on for longer than absolutely necessary.

**Low-beam headlight**
The low-beam headlight switches on automatically when you start the engine.

**High-beam headlight and headlight flasher**
- Start the engine.
- Push button 1 forward to switch on the high-beam headlight.
- Pull button 1 back to operate the headlight flasher.

**Parking lights**
- Switch off the ignition.
- Immediately after switching off the ignition, push button 1 to the left and hold it in this position until the parking lights come on.
- Switch the ignition on and off again to switch off the parking lights.
Turn indicators
Operating the turn indicators
• Switch on the ignition.

Push button 1 to the left to switch on the left turn indicators.
Push button 1 to the right to switch on the right turn indicators.
Operate centre button 1 to cancel the turn indicators.

The turn indicators are cancelled automatically after the defined time and distance. The defined time and distance can be set by an authorised BMW Motorrad dealer.

Hazard warning flashers
Switching on hazard warning flashers
• Switch on the ignition.

The hazard warning flashers place a strain on the battery. Do not use the hazard warning flashers for longer than absolutely necessary.
If you press a turn-indicator button with the hazard warning flashers switched on, the turn-indicator function is activated instead of the hazard warning flashers, and remains active until you release the button. The hazard warning flashers recommence flashing as soon as the button is released.

Press button 1 to switch on the hazard warning flashers.
Ignition can be switched off.
To switch off the hazard warning flashers, switch on the ignition and press button 1 again.
Emergency off switch (kill switch)

1 Emergency off switch (kill switch)

Operating the kill switch when riding can cause the rear wheel to lock and thus cause a fall. Do not operate the kill switch when riding.

The emergency off switch is a kill switch for switching off the engine quickly and easily.

Heated handlebar grips

- with heated handlebar grips

Operating the heated handlebar grips

- Start the engine.

The heating in the heated handlebar grips can be activated only when the engine is running.

The increase in power consumption caused by having the heated handlebar grips switched on can drain the battery if you are riding at low engine speeds. If the charge level is low, the heated handlebar grips are switched off to ensure the battery's starting capability.

Repeatedly press button 1 until the desired heating stage appears on the display.
The handlebar grips have two-stage heating. Stage two is for heating the handlebar grips quickly: it is advisable to switch to stage one as soon as the grips are warm.

- 100% heating power
- 50% heating power

The selected heating stage will be saved if you allow a certain length of time to pass without making further changes.

**BMW Motorrad Race ABS**

**Switch off the ABS function**

- Switch on the ignition.
- ABS Pro is used in much the same way as BMW Motorrad Race ABS.
- You have the option of de-activating the ABS function while the motorcycle is on the move.

Press and hold down button 1 until first DTC warning light 2 and then ABS warning light 3 change their status.

- The DTC setting remains unchanged.
- ABS warning light flashes.
- Release button 1 within two seconds.
- ABS warning light continues to flash.
- ABS function is switched off.
Activating the ABS function

- Press and hold down button 1 until ABS warning light 3 changes status.
- ABS warning light goes out; if self-diagnosis has not completed it starts flashing.
- Release button 1 within two seconds.
- ABS warning light remains off or continues to flash.
- The ABS function is activated.

- If the coding plug for the SLICK function is not inserted, you have the option of switching the ignition off and then on again.
- An ABS fault has occurred if the ABS warning light shows when the motorcycle accelerates to a speed in excess of 5 km/h after the ignition was switched off and then on again.

Dynamic Traction Control DTC

Switch off the DTC function

- Switch on the ignition.
- You have the option of deactivating the DTC function while the motorcycle is on the move.

- Press and hold down button 1 until DTC warning light 2 changes status.
- DTC warning light starts to show.
- Release button 1 within two seconds.
- DTC warning light remains ON.
- DTC function is switched off.
Switch on the DTC function

1. Press and hold down button 1 until DTC warning light 2 changes status.
   - DTC warning light goes out; if self-diagnosis has not completed it starts flashing.
   - Release button 1 within two seconds.
   - DTC warning light remains off or continues to flash.
   • DTC function is switched on.

2. If the coding plug for the SLICK riding mode is not inserted, you have the alternative of switching the ignition off and then on again.

   An DTC fault has occurred if the DTC warning light shows when the motorcycle accelerates to a speed in excess of 5 km/h after the ignition was switched off and then on again.

Riding mode

Setting riding mode

• Press button 1.

See the section entitled "Engineering details" for more information on the various ride modes that can be selected.

• Switch on the ignition.
Arrow 1 and selection menu 2 are displayed. The current setting is shown at position 3.

If the coding plug has been inserted, the menu includes the SLICK mode 4 as an extra selectable item.

- Installing coding plug (47).

The SLICK mode is set up for racing slicks and the assumption on which the parameter settings are based is that tyre-to-surface grip is of the very high level generally encountered only on race tracks.

Activate SLICK mode only on race tracks and only when running the motorcycle on racing slicks.

In RACE and in SLICK mode, there is an increased risk of rollover because the rear wheel lift-off protection system is switched off. In SLICK mode, there is an additional risk of accident because ABS control at the rear wheel is switched off when only the footbrake lever is pressed.

When braking sharply, be prepared for the rear wheel lifting off the ground.

- Repeatedly press button 1 until the arrow is to the left of the setting you want.
- With the motorcycle at a standstill, the mode you select is activated immediately.

The newly selected riding mode is activated as you ride only when the following preconditions are satisfied:
- Brake not applied.
Throttle twistgrip in fully closed position.
- Clutch pulled.
- Once the new ride mode has been activated, the selection menu disappears from the display.
- The mode selected in this way is retained with the engine-characteristic, ABS, DTC and DDC adaptation settings even after the ignition has been switched off.

In SLICK mode, the current DTC fine-tuning settings are also shown 5:
- DTC Adapting (⇒ 98).

**Installing coding plug**
- Switch off the ignition.
- with reduced power output, 79 kW<sup>OE</sup>

⚠️ The following applies to motorcycles with power reduction: Once the coding plug has been inserted, the choice of riding modes includes SPORT and RACE with increased engine power. Adapt your style of riding accordingly to allow for the markedly more sporty handling and performance with considerably more engine power. It is important for the rider intending to use these more sporty ride modes to familiarise himself/herself with their characteristics.

⚠️ The following applies to motorcycles with power reduction: Inserting the coding plug voids homologation for riding the motorcycle on public roads. Do not use the coding plug for riding these vehicles on public roads.

- Switch off the ignition.<br>
- Remove the front seat (⇒ 57).

Dirt and moisture can penetrate the open plug and lead to malfunctions.
Reinstall the cap after removing the coding plug.

- Open cable tie and remove cap from plug connection 1.

47
To do so, press retainer 2 and pull the cap up.
Install coding plug and secure plug connection with a new cable tie.
Switch on the ignition.

When the coding plug is inserted, RAIN mode 1 is activated automatically for safety reasons.

Installation of front seat (§ 57).

Clutch

With Competition Kit OE

Adjusting clutch lever

Attempting to adjust the clutch lever while riding the motorcycle can lead to accidents. Do not attempt to adjust the clutch lever unless the motorcycle is at a standstill.

- Turn adjusting screw 1 in direction A to increase the distance between handlebar grip and clutch lever.
- Turn adjusting screw 1 in direction B to decrease the distance between handlebar grip and clutch lever.

The adjusting screw is easier to turn if you push the clutch lever forward.
Brakes

Adjusting handlebar lever

⚠ Changing the position of the brake-fluid reservoir can allow air to penetrate the brake system. Do not twist the handlebar fitting or the handlebars.

⚠ Attempting to adjust the handbrake lever while riding the vehicle can lead to accidents. Do not attempt to adjust the handbrake lever unless the motorcycle is at a standstill.

- Applying light pressure from behind, turn adjusting screw 1 to the desired position.

  The adjusting screw is easier to turn if you push the handlebar lever forward.

  » Adjustment options:
  - from position 1: widest span between handlebar grip and handlebar lever
  - to position 6: narrowest span between handlebar grip and handlebar lever

  - with Competition Kit OE

  • Turn adjusting screw 2 in direction A to increase the span between handlebar grip and handlebar lever.
  • Turn adjusting screw 2 in direction B to decrease the span between handlebar grip and handlebar lever.

  The adjusting screw is easier to turn if you push the handlebar lever forward.
Adjusting footbrake lever

- with Competition Kit OE
- Make sure the ground is level and firm and place the motorcycle on its stand.

1. Remove screw 1.
2. Hold peg 2 in the desired position and tighten screw 1 to the specified tightening torque.

Peg on pedal

10 Nm

   - The footrests can be moved forwards/backwards and tilted upwards/downwards using the sliding action.
   - Move footrest 4 into the desired position and tighten screw 3 to the specified tightening torque.

4. Move footrest 4 into the desired position and tighten screw 3 to the specified tightening torque.

Clamping of the adjusted footrests

28 Nm

5. In order to restore the factory settings, align scales 5 and 6 to zero.

Shift mechanism
- with Competition Kit OE

Adjusting shift lever
- Make sure the ground is level and firm and place the motorcycle on its stand.
- Remove screw 1.
- Hold peg 2 in the desired position and tighten screw 1 to the specified tightening torque.

Peg on pedal
10 Nm

- Slacken screw 3.
- The footrests can be moved 4 forwards/backwards and tilted upwards/downwards using the sliding action.
- Move footrest 4 into the desired position and tighten screw 3 to the specified tightening torque.

Clamping of the adjusted footrests
28 Nm

- In order to restore the factory settings, align scales 5 and 6 to zero.

By adjusting the footrest, the position of the shift lever changes. A poorly adjusted shift lever has a negative effect on the shift ability of the gearbox. To adjust the height of the shift lever, seek the advice of a specialist workshop, preferably an authorised BMW Motorrad dealer.
Mirrors

Adjusting mirrors

- Turn the mirror to the correct position.

Spring preload

Adjustment

Front spring preload has to be adjusted to suit the rider’s weight. Increase spring preload for heavier riders, decrease spring preload for lighter riders. It is essential to set spring preload of the rear suspension to suit the load carried by the motorcycle. Increase spring preload when the vehicle is heavily loaded and reduce spring preload accordingly when the vehicle is lightly loaded.

Adjusting spring preload for front wheel

- Make sure the ground is level and firm and place the motorcycle on its stand.
- Make sure there is no load on the motorcycle; remove all items of luggage, if carried.
- Start the engine and leave it running in neutral.

Hold the motorcycle upright and measure distance \( d \) from bottom edge 1 of the slider tube to front axle 2.

- Apply the rider’s weight to the motorcycle.
- With the assistance of a second person, measure distance \( d \) between points 1 and 2 again and calculate the difference (negative spring displacement) between the two readings.
Load-dependent adjustment of spring preload

Negative spring displacement of front wheel
5...10 mm (With rider 85 kg)

To reduce negative spring displacement (increase spring preload, in other words), use the tool from the on-board toolkit to turn adjusting screw 3 in direction A.

To increase negative spring displacement (reduce spring preload, in other words), use the tool from the on-board toolkit to turn adjusting screw 3 in direction B.

Adjusting spring preload for rear wheel

- Make sure the ground is level and firm and place the motorcycle on its stand.
- Make sure there is no load on the motorcycle; remove all items of luggage, if carried.
- Start the engine and leave it running in neutral.

Hold the motorcycle upright and measure distance d from bottom edge 1 of the number-plate carrier to screw 2 of the chain guard.

Apply the rider’s weight to the motorcycle.

With the assistance of a second person, measure distance d between points 1 and 2 again and calculate the difference (negative spring displacement) between the two readings.

Load-dependent adjustment of spring preload

Negative spring displacement of rear wheel
8...12 mm (With rider 85 kg)
To reduce negative spring displacement (increase spring preload, in other words), use the tool from the on-board toolkit to turn hexagon 3 in direction A.

To increase negative spring displacement (reduce spring preload, in other words), use the tool from the on-board toolkit to turn hexagon 3 in direction B.

**Tyres**

**Checking tyre pressure**

Incorrect tyre pressures impair the motorcycle’s handling characteristics and increase the rate of tyre wear. Always check that the tyre pressures are correct.

At high road speeds, tyre valves have a tendency to open as a result of centrifugal force. Fit valve caps with rubber seals and screw them on firmly to prevent sudden deflation.

Make sure the ground is level and firm and place the motorcycle on its stand.

Check tyre pressures against the data below.

<table>
<thead>
<tr>
<th>Tyre pressure, front</th>
<th>2.5 bar (Tyre cold)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tyre pressure, rear</td>
<td>2.9 bar (Tyre cold)</td>
</tr>
</tbody>
</table>

If tyre pressure is too low:

- Correct tyre pressure.

**Headlight**

**Adjusting headlight for driving on left/driving on right**

This motorcycle has a symmetric-beam low-beam headlight. If the motorcycle is ridden in a country where the opposite rule of the road applies, its symmetric low-beam headlight means that no measures are necessary to prevent the headlight beam from dazzling oncoming traffic.
Headlight beam throw and spring preload
Headlight beam throw is generally kept constant when spring preload is adjusted to suit load.

If there are doubts about the correct headlight beam throw, have the setting checked by a specialist workshop, preferably an authorised BMW Motorrad dealer.

Front and rear seats
Removing rear seat cover
- Make sure the ground is level and firm and place the motorcycle on its stand.

Installing rear seat cover
- Open lock 1 in the rear seat cover with the ignition key.
- Lift the cover at the rear and then work it back and up to remove.
- Engage the rear seat cover in mounts 2 on left and right.
- Swing the rear seat cover down, pushing it lightly forward.
Lock the lock with the ignition key.

**Removing rear seat**
- with Passenger Bundle<sup>OE</sup>

- Make sure the ground is level and firm and place the motorcycle on its stand.

- Open seat lock <sup>1</sup> with the ignition key.
- Lift the rear seat at the rear and then work it back and up to remove.
- Remove the ignition key from the lock and place the rear seat, upholstered side down, on a clean surface.

**Installing rear seat**
- with Passenger Bundle<sup>OE</sup>

- Swing the rear seat down, pushing it lightly forward.
- Lock the seat lock with the ignition key.

- Engage the rear seat in mounts <sup>2</sup> on left and right.
Removing front seat

- Push the upholstery of the front seat forward slightly above screws 1 and hold it in this position.
- Remove the screws.
- Push the seat forward and lift it at the rear to remove. Take care not to let the screws scratch the trim panels.
- Place the seat, upholstered side down, on a clean surface.

Installing front seat

- Engage the front seat in mount 2, then lower the rear of the seat to bring the holes into alignment with screw holes 3. Take care not to let the screws scratch the trim panels.
- Push the upholstery of the front seat forward slightly above screws 1 and hold it in this position.
- Install screws 1.

Helmet holder

Securing the helmet to motorcycle

- Removing rear seat cover (p. 55).
- Turn the cover upside down.
The helmet catch can scratch the panelling.

Make sure the lock is out of the way when you hook the helmet into position.

- Use a plastic-sheathed steel cable to secure the helmet to helmet holder 1.
- Installing rear seat cover (55).
- Place the helmet on the front seat.
- with Passenger Bundle OE
- Removing rear seat (56).

- Turn the rear seat upside down.

The helmet catch can scratch the panelling.

Make sure the lock is out of the way when you hook the helmet into position.

- Use a plastic-sheathed steel cable to secure the helmet to helmet holder 1.
- Installing rear seat (56).
- Place the helmet on the front seat.

Luggage loops
- with Passenger Bundle OE

Securing luggage to motorcycle
- Removing rear seat (56).
- Turn the rear seat upside down.

- Pull luggage loops 1 out of the holders and to the outside and down.
- Installing rear seat (56).
Use luggage loops 1 and the rear footrests, for example, to secure luggage to the rear seat. In this process, take care not to damage the rear trim panels.

Securing motorcycle for transporta-

tion ............................... 73
Safety instructions

Rider's equipment
Do not ride without the correct clothing! Always wear:
- Helmet
- Motorcycling jacket and trousers
- Gloves
- Boots

This applies even to short journeys, and to every season of the year. Your authorised BMW Motorrad dealer will be glad to advise you on the correct clothing for every purpose.

Loading

⚠ Overloading and imbalanced loads can adversely affect the handling.
Do not exceed the permissible gross weight and be sure to comply with the instructions on loading.

- Adjusting spring preload setting and damping to the total weight.

Speed
If you ride at high speed, always bear in mind that various boundary conditions can adversely affect the handling of your motorcycle:
- Settings of the spring-strut and shock-absorber system
- Imbalanced load
- Loose clothing
- Insufficient tyre pressure
- Poor tyre tread
- Etc.

Top speed

⚠ The motorcycle's top speed might be higher than the maximum speed permitted for the tyres. Excessive speeds can damage the tyres and this could cause accidents.
Comply with the tyre-specific speed restrictions.
Affix a label stating the maximum permissible speed in the rider's field of vision.

Risk of poisoning
Exhaust fumes contain carbon monoxide, which is colourless and odourless but highly toxic.

⚠ Inhaling the exhaust fumes therefore represents a health hazard and can even cause loss of consciousness with fatal consequences.
Do not inhale exhaust fumes.
Do not run the engine in an enclosed space.

Risk of burn injury

⚠ Engine and exhaust system become very hot when the vehicle is in use. There is a risk of burn injuries by contact with hot surfaces.
When you park the vehicle make sure that no-one comes into contact with the engine and exhaust system.

Catalytic converter
If misfiring causes unburned fuel to enter the catalytic converter, there is a danger of overheating and damage. For this reason, observe the following points:
- Do not run the fuel tank dry.
- Do not attempt to start or run the engine with a spark-plug cap disconnected.
- Stop the engine immediately if it misfires.
- Use only unleaded fuel.
- Comply with all specified maintenance intervals.

Unburned fuel will destroy the catalytic converter. Note the points listed for protection of the catalytic converter.

Risk of overheating
⚠ Cooling would be inadequate if the engine were allowed to idle for a lengthy period with the motorcycle at a standstill: overheating would result. In extreme cases, the motorcycle could catch fire. Do not allow the engine to idle unnecessarily. Ride away immediately after starting the engine.

Tampering
⚠ Tampering with motorcycle settings (e.g. electronic engine management unit, throttle valves, clutch) can cause damages to the components in question and lead to failure of safety-relevant functions. Damage caused in this way is not covered by the warranty. Do not tamper with the vehicle in any way that could result in tuned performance.

Checklist
Use the following checklist to check important functions, settings and wear limits.

Before each journey
- Brakes
- Brake-fluid levels, front and rear
- Clutch function
- Shock absorber setting and spring preload
- Tyre tread depth and tyre pressures
- Security of the luggage
- Tension and lubrication of the drive chain.

At regular intervals
- Engine oil level (every refuelling stop)
- Brake-pad wear (every third refuelling stop)
Starting
Starting engine

- Switch on the ignition.
  - Pre-Ride-Check is performed. (☞ 64)
- ABS self-diagnosis is in progress. (☞ 65)
- DTC self-diagnosis is in progress. (☞ 65)
- Select neutral or, if a gear is engaged, pull the clutch lever.

You cannot start the motorcycle with the side stand extended and a gear engaged. The engine will switch itself off if you start it with the gearbox in neutral and then engage a gear before retracting the side stand.

- When starting a cold engine at low ambient temperatures: disengage the clutch and turn the twistgrip slightly to open the throttle.

Press starter button 1.

The start attempt is automatically interrupted if battery voltage is too low. Recharge the battery before you start the engine, or use jump leads and a donor battery to start. See the subsection on jump starting in "Maintenance" for more details.

- The engine starts.

Consult the troubleshooting chart below if the engine refuses to start. (☞ 168)

Pre-Ride-Check

The instrument panel runs a test of the warning lights and the revolution counter when the ignition is switched on; this is the Pre-Ride-Check. The test is aborted if you start the engine before it completes.

Phase 1

Telltale and warning lights light up, 'General' warning light shows yellow.
The needle of the revolution counter moves all the way to the position for maximum engine revolutions.
All the segments in the display light up.

Phase 2

The 'General' warning light changes from yellow to red.
Phase 3
The needle of the revolution counter moves to the position for zero engine revolutions. The telltale and warning lights go out.

– with ABS Pro OA

ABS Pro appears if the RAIN or SPORT riding mode is selected.

The display switches to its ordinary display mode.

If a warning light does not show:

Some malfunctions cannot be indicated if one of the warning lights fails to show. Make sure that all the warning and telltale lights come on in the pre-ride check.

• Have the fault rectified as quickly as possible by a specialist workshop, preferably an authorised BMW Motorrad dealer.

ABS self-diagnosis
BMW Motorrad Race ABS performs self-diagnosis to ensure its operability. Self-diagnosis is performed automatically when you switch on the ignition. The motorcycle has to move forward a few metres for the wheel-speed sensors to be tested.

Phase 1
• Test of the diagnosis-compatible system components with the vehicle at a standstill.

ABS warning light flashes.

Phase 2
• Test of the wheel-speed sensors as the vehicle pulls away from rest.

ABS warning light flashes.

ABS self-diagnosis completed
The ABS warning light goes out.

If an indicator showing an ABS fault appears when ABS self-diagnosis completes:

• You can continue to ride. Bear in mind that neither the ABS function nor the integral braking function is available.

• Have the fault rectified as quickly as possible by a specialist workshop, preferably an authorised BMW Motorrad dealer.

DTC self-diagnosis
BMW Motorrad DTC performs self-diagnosis to ensure its operability. Self-diagnosis is performed automatically when you switch on the ignition.
Phase 1
> Test of the diagnosis-compatible system components with the vehicle at a standstill.

DTC warning light slow-flashes.

Phase 2
> Test of the diagnosis-compatible system components while the motorcycle is on the move. The motorcycle must reach a speed of at least 5 km/h in order for DTC self-diagnosis to complete.

DTC warning light slow-flashes.

DTC self-diagnosis completed
> The DTC symbol no longer shows.

If an indicator showing an DTC fault appears when DTC self-diagnosis completes:
- You can continue to ride. Bear in mind that the DTC function is not available or the functionality is subject to certain restrictions.
- Have the fault rectified as quickly as possible by a specialist workshop, preferably an authorised BMW Motorrad dealer.

Running in

Engine
- Until the running-in check, vary the throttle opening and engine-speed range frequently; avoid riding at constant engine rpm for prolonged periods.
- Try to do most of your riding during this initial period on twisting, fairly hilly roads.
- Comply with the rpm limits for running in.

The electronic engine management system prevents the engine from revving past the preset rpm limit for running in. The authorised BMW Motorrad dealer deactivates this monitoring function when the motorcycle is brought in for its running-in check.

Running-in speed
| <7000 min⁻¹ (Odometer reading 0...300 km) |
| <9000 min⁻¹ (Odometer reading 300...1000 km) |
| no full load (Odometer reading 0...1000 km) |
- Do not omit the running-in check after 500 - 1200 km.
Brake pads
New brake pads have to bed down before they can achieve their optimum friction levels. You can compensate for this initial reduction in braking efficiency by exerting greater pressure on the levers.

⚠️ New brake pads can extend stopping distance by a significant margin.
Apply the brakes in good time.⚠️

Tyres
New tyres have a smooth surface. This must be roughened by riding in a restrained manner at various heel angles until the tyres are run in. This running in procedure is essential if the tyres are to achieve maximum grip.

⚠️ New tyres do not provide full grip straight away. Wet roads and extremely sharp inclines pose a risk of accident.

Ride carefully and avoid extremely sharp inclines.⚠️

Shifting gear
Shift light
Shift light 1 shows the rider two engine-speed thresholds:

Pullaway engine speed
When the motorcycle is at a standstill with the engine running, the shift light indicates the ideal engine speed for a racing start.

- Shift light off: engine speed too low
- Shift light on: ideal engine speed for pulling away
- Shift light flashing: engine speed too high

Shift speed
When the motorcycle is on the move, the shift light indicates the engine speed at which the rider should upshift.

- Shift light flashes at preset frequency: Approaching upshift rpm
- Shift light goes out: the engine has reached the ideal speed for an upshift.

The engine-speed thresholds and the way in which the shift light indicates the various states can be customised in the SETUP menu.
Speed limit
If the shift light flashes or comes on while the motorcycle is being ridden and ! SPEED appears on the display, you have exceeded the preset top speed.

Shift assistant
Your motorcycle is equipped with a shift assistant evolved from motorcycle-racing technology; the shift assistant enables you to upshift in virtually all load and engine-rpm ranges without pulling the clutch or changing the throttle-valve angle. The throttle valve remains open to accelerate the motorcycle and upshift time is reduced to a minimum. You select the gear in the usual way by means of the foot-operated shift lever.

The sensor 1 in the shift linkage registers the shift request and triggers shift assistance.

When you are riding at constant speed with the engine revving high in a low gear, upshifting without disengaging the clutch can cause a severe reaction to the load change. BMW Motorrad recommends disengaging the clutch for upshifts in these circumstances. It is advisable to avoid using the shift assistant at engine speeds close to the limits at which the governor cuts in to limit engine rpm.

Shift assistance is not available in the following situations:
- Gearshifts with the clutch disengaged.
- Gearshifts with the throttle valve closed (engine overrun).
- Downshifts.

Steering
Adjusting steering damper

Attempting to adjust the steering damper while the motorcycle is being ridden can lead to accidents.

Do not attempt to adjust the
steering damper unless the motorcycle is at a standstill.

- Turn adjusting screw 1 in direction A to increase damping.
- Turn adjusting screw 1 in direction B to reduce damping.

Steering damper basic setting

Open 5 clicks (from fully closed) (Public roads)
Open 2 clicks (from fully closed) (Race track)

Brakes

How can stopping distance be minimised?
Each time the brakes are applied, a load distribution shift takes place with the load shifting forward from the rear to the front wheel. The sharper the vehicle decelerates, the more load is shifted to the front wheel. The higher the wheel load, the more braking force can be transmitted without the wheel locking. To optimise stopping distance, apply the front brakes rapidly and keep on increasing the force you apply to the brake lever. This makes the best possible use of the dynamic increase in load at the front wheel. Remember to pull the clutch at the same time.

In the "panic braking situations" that are trained so frequently, braking force is applied as rapidly as possible and with the rider’s full force applied to the brake levers; under these circumstances, the dynamic shift in load distribution cannot keep pace with the increase in deceleration and the tyres cannot transmit the full braking force to the surface of the road. Under these circumstances the front wheel can lock up.

BMW Motorrad Race ABS prevents the front wheel from locking up.

Descending mountain passes

There is a danger of the brakes fading if you use only the rear brakes when descending mountain passes. Under extreme conditions, the brakes could overheat and suffer severe damage.
Use both front and rear brakes, and make use of the engine’s braking effect as well.

Wet and dirty brakes

Wetness and dirt on the brake discs and the brake pads diminish braking efficiency. Delayed braking action or poor braking efficiency must be reckoned with in the following situations:

<table>
<thead>
<tr>
<th>5</th>
</tr>
</thead>
<tbody>
<tr>
<td>69</td>
</tr>
</tbody>
</table>

Riding
Riding in the rain or through puddles of water.
- After the motorcycle has been washed.
- Riding on salted or gritted roads.
- After work has been carried on the brakes, due to traces of oil or grease.
- Riding on dirt-covered surfaces or off-road.

Wetness and dirt result in poor braking efficiency. Apply the brakes lightly while riding to remove wetness and dirt, or dismount and clean the brakes. Think ahead and brake in good time until full braking efficiency is restored.

ABS Pro
- with ABS Pro OA

Physical limits applicable to motorcycling

Even ABS Pro is constrained by the laws of physics as they apply to motorcycling. Invariably, it remains the rider’s responsibility to adapt riding style to riding conditions. Do not take risks that would negate the additional safety offered by this system.

Availability of ABS Pro
- ABS Pro is available in the RAIN and SPORT riding modes.
- The RACE and SLICK riding modes are not supported by the ABS Pro function.

Possibility of a fall not precluded
Although ABS Pro provides the rider with valuable assistance and constitutes a huge advance in safety for braking with the motorcycle banked for cornering, it cannot under any circumstances be considered as redefining the physical limits that apply to motorcycling. It is still possible for these limits to be overshot due to misjudgement or rider error. In extreme cases this can result in a crash.

ABS Pro not developed for race-circuit use
ABS Pro was not developed for race-circuit use to enhance individual braking performance with the motorcycle banked into corners.
On the contrary, ABS Pro helps make the motorcycle even safer for riding on public roads. When
the brakes are applied because of an unforeseen hazard when the motorcycle is banked for cornering, within the physical limits that apply to motorcycling the system prevents the wheels from locking and skidding away.

**On the race track**
For riders of limited experience, first attempts at race-track riding are much safer in the RAIN and SPORT riding modes with ABS Pro.

ABS Pro was not developed to enhance individual braking performance with the motorcycle banked into corners.

**Use on public roads**
ABS Pro was intentionally designed for use on public roads.

---

**Parking your motorcycle**

**Side stand**
- Switch off the engine.
- If the ground is soft or uneven, there is no guarantee that the motorcycle will rest firmly on the stand.
- Always check that the ground under the stand is level and firm.
- Extend the side stand and prop the motorcycle on the stand.
- The side stand is designed to support only the weight of the vehicle.
- Do not lean or sit on the vehicle with the side stand extended.
- If the camber of the roadway permits, turn the handlebars all the way to the left.
- On a gradient, the motorcycle should always face uphill; select 1st gear.

---

**Refuelling**

**Fuel grade**
For optimum fuel consumption, fuel should be sulphur-free or with the lowest sulphur content possible.

- Leaded fuel will destroy the catalytic converter.
- Do not attempt to run the vehicle on leaded fuel or fuel with metallic additives, e.g. manganese or iron.
- You can run the engine on fuel with a maximum ethanol content of 10 %, i.e. E10.

<table>
<thead>
<tr>
<th>Recommended fuel grade</th>
<th>5 RON</th>
<th>71 AKI</th>
</tr>
</thead>
<tbody>
<tr>
<td>Super unleaded (max. 10 % ethanol, E10)</td>
<td>95 ROZ/RON</td>
<td>89 AKI</td>
</tr>
</tbody>
</table>
Refuelling

Fuel is highly flammable. A naked flame close to the fuel tank can cause a fire or explosion.

Do not smoke. Never bring a naked flame near the fuel tank.

Fuel expands when hot. Fuel escaping from an overfilled tank could make its way onto the road surface. This could cause a fall.

Do not overfill the fuel tank.

Fuel attacks plastics, which become dull or unsightly. Wipe plastic parts immediately after contact with fuel.

Make sure the ground is level and firm and place the motorcycle on its side stand.

The volume of the tank can be utilised to the full only when the motorcycle is propped on its side stand.

Open the protective cap.

Use the ignition key to unlock cap 1 of the fuel tank and pop the cap open.

Refuel with fuel of the grade stated above; do not fill the tank past the bottom edge of the fuel filler neck.

If filling occurs after the fuel level has gone below the reserve limit, the amount filled must be greater than the reserve amount for the new fuel level to be recognised and the warning light to switch off.

The "usable fuel capacity" specified in the technical data is the quantity that the fuel tank could hold if it had been run dry and the engine had cut out due to a lack of fuel.

<table>
<thead>
<tr>
<th>Usable fuel capacity</th>
<th>approx. 17.5 l</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reserve fuel</td>
<td>approx. 4 l</td>
</tr>
</tbody>
</table>
• Press the fuel tank cap down firmly to close.
• Remove the key and close the protective cap.

**Securing motorcycle for transportation**

• Make sure that all components that might come into contact with straps used to secure the motorcycle are adequately protected against scratching. Use adhesive tape or soft cloths, for example, for this purpose.

• Remove screws 1 and remove the cover panel of the bottom fork bridge.

• When being lifted on to a stand, the vehicle can topple and fall on its side. Secure the vehicle to prevent it toppling, preferably with the assistance of a second person.

• Push the motorcycle onto the transportation flat and hold it in position: do not place it on the side stand.

• At the front, loop a strap over the bottom fork bridge on each side.

• Risk of damaging components. Take care not to trap components such as brake lines or wires.
Pull the straps down and tight.

Place the straps behind on both sides over the rear frame and tighten.

Tighten all the straps uniformly; the vehicle’s suspension should be compressed as tightly as possible front and rear.

Multifunction display

Selecting the display mode

Repeatedly press button 2 until the reading shows the mode you want.

ROAD mode: The ROAD mode provides you with all the information necessary for riding on public roads. All the descriptions not included in this section apply to this mode.

LAPTIMER mode: In LAPTIMER mode you can save lap times and other data for subsequent viewing in the INFO mode.

INFO mode: The data saved beforehand in LAPTIMER mode can be viewed in INFO mode. Note that this mode can be activated only when the motorcycle is at a standstill.

SETUP mode: SETUP mode is for customising damping and the way in which the instrument panel works in line with individual preferences. Note that this mode can be activated only when the motorcycle is at a standstill.

Speed warning: You can set a speed above which a warning is issued. This function has to be switched on in SETUP mode.

When the display shows the INFO-MENU or the SETUP-MENU, as applicable, press and hold down button 2 to activate the mode.
Overview of mode selection

- Solid line: short-press the button.
- Broken line: press and hold down the button.

1. Control of odometer (⇒ 30)
2. Setting the clock (⇒ 37).
3. Starting timing (⇒ 80).
4. Starting INFO menu (⇒ 83)
5. Starting SETUP menu (⇒ 88)
6. Speed warning (⇒ 36)
LAPTIMER mode

Mode of presentation

1 Speedometer
2 Current lap
3 Engine temperature
4 The readings in these lines can be changed by the rider. (☞ 78)
   Shown here: Time for the last completed lap (LASTLAP) and the current lap time.
5 Riding mode selected by the rider
6 Gear indicator

Labels for the values shown on the display

The following times can be displayed in the second line:
- The time for the preceding lap, labelled "LASTLAP".
- The running time for the current lap.

The following times can be displayed in the third line:
- The fastest lap saved, labelled "BESTLAP"
- The all-time best lap, no label
- The running time for the current lap.

The possible combinations are described on page (☞ 93).

At the start of each new lap the time for the preceding lap is shown briefly before the display switches to the running time of the current lap. The length of this freeze period can be set as described on page (☞ 96).
Overview of LAPTIMER mode

- Solid line: short-press the button.
- Broken line: press and hold down the button.
1. Ending timing (=> 81).
2. Interrupting timing (=> 81).
3. Starting timing (=> 80).
4. Customising display layout (=> 80).
Customising display layout

To change the layout of the display in LAPTIMER mode, repeatedly press button 2 until the layout of the display suits your preferences.

Starting timing

- Press button 1 to start timing. The engine has to be running in order for the headlight-flasher signal to be detected.
- Every time you cross the start/finish line, press button 1 again to start timing for the next lap.
- The data of the preceding lap are written into memory.
- Timing continues even if you exit the display mode. In the other modes, however, timing of another lap can be started only by an external signal.

Infrared receiver

- with infrared receiver OA

An infrared signal provides a convenient way of operating the instrument panel in LAPTIMER mode. It can be operated in this way only when the infrared receiver available as an optional accessory is connected. The headlight flasher button can be used to operate the instrument panel even when the infrared receiver is installed.

A lap timeout can be defined to stop the receiver from registering completion of a lap prematurely in response to spurious signals (96). Signals received before this time elapses are ignored.
Interrupting timing

- Press button 1 to interrupt timing.
- Press button 1 again to resume timing.

Ending timing

- Begin by pressing button 1 to interrupt timing.
- To save the reading as the last lap time, press and hold down button 1 until -- : -- : -- appears. Then press button 2 to switch to display mode.
- If you do not want to save the reading, press button 2 to switch to the display mode.

If more laps are subsequently timed, lap numbering resumes. Numbering is not restarted at lap 1 unless you delete the current timing session in the RACE INFO display mode.

Fastest lap anticipated

This function has to be activated in the SETUP menu (97).

When you start a new lap your intermediate times are taken every 100 metres and compared with the corresponding intermediate times of the best lap stored in memory. If your intermediate times show that you are faster than on your previous best lap the processor anticipates that this lap will be your new best.
time. "Fastest lap" indicator lights up.
INFO mode
Selecting saved lap

- Repeatedly press button 1 or button 2 to view each lap stored in memory one after the other.

If you pull away from rest in this mode the electronics switch automatically to ROAD mode.

Each time button 1 is pressed the laps saved in memory are shown in the sequence described below; each time button 2 is pressed the laps are shown in reverse sequence:
- All-time best lap (ATBEST)
- Best lap saved (BEST)
- Last lap saved (LAST)
- All other laps saved in memory
- Aggregate time for all laps saved in memory (TOTAL)
- Exiting INFO mode (INFO RETURN)
- Option for deleting the data from memory (INFO CLEAR ALL) (except all-time best lap).
Overview of INFO mode

- Solid line: short-press the button.
- Broken line: press and hold down the button.
1. Selecting saved lap (⇒ 83).
2. Deleting lap times (⇒ 87).
3. Direct jump to the CLEAR ALL menu.
4. Exiting INFO mode (⇒ 85).
5. Clearing all saved data (⇒ 86).
6. Activating ROAD mode (⇒ 86).
Information per lap

1 Alternately: Top speed (max) and lowest speed (min) on the lap currently displayed.
2 Lap for which the data on the display apply.
3 Alternately: Average throttle-twistgrip position (TH) in percent, percentage of lap ridden with brakes applied (BR) and number of gearshifts (G) on the lap currently displayed.
4 Lap time for the lap currently displayed.

Exiting INFO mode

- Repeatedly press button 1 or button 2 until INFO RETURN appears on the display.
- Press and hold down button 2 to exit the INFO menu.
- The readings already recorded remain saved in memory.

On the race track
On the race track

Clearing all saved data

- Hold down button 1 until INFO CLEAR ALL appears.
- Hold down button 2 to clear all the saved data and return to the LAPTIMER mode.

Activating ROAD mode

- Hold down button 1 until INFO CLEAR ALL appears.
- Press and hold down button 1 to return to the ROAD mode.
- The readings already recorded remain saved in memory.

All-time best lap

The all-time best lap (ATBEST) is the fastest of all timed laps and is updated as soon as a faster lap is timed.

The all-time best lap remains stored in memory even if the timed laps are deleted. This means that other races can subsequently be timed and the lap times of those races compared with the best lap from earlier races.

The all-time best lap can also be deleted from memory.

If the all-time best lap is from a race timed in the past, it is accompanied on the display by the appropriate lap number. If the all-time best lap shows without a lap number, this lack of a lap number indicates that the time is from a race timed in the past but subsequently deleted from memory.
Deleting lap times

- Repeatedly press button 1 or button 2 until the lap you want to delete appears on the display.
- Press and hold down button 2 to delete the lap from memory.
  » If the lap you select for deletion was
  »  the all-time best lap ATBEST, the next best lap time in memory becomes the new all-time best lap.
  »  the best lap in memory BEST, the lap in question is deleted. The lap that was the second-best time until the best time was deleted becomes the new best lap.
  »  the last lap in memory LAST, the lap in question is deleted. The lap that was the second-last time until the last time was deleted becomes the new last lap.
  »  a lap stored in memory, the lap in question is deleted. The numbering of the remaining laps remains unchanged.
  »  Total time is reduced by the time for the laps you delete.
SETUP mode

Selecting a parameter

Repeatedly press button 1 or button 2 until the parameter you want appears on the display.

If you pull away from rest in this mode the electronics switch automatically to ROAD mode.

Each time button 1 is pressed the possible parameters are shown in the sequence described below; each time button 2 is pressed the parameters are shown in reverse sequence:

- Rebound damping, rear (REB DDC–RE)
- Compression damping, rear (COM DDC–RE)
- Suspension damping, front (DMP DDC–FR)
- Rebound damping, front (REB DDC–FR), only with height sensor (Racing accessories)
- Compression damping, front (COM DDC–FR), only with height sensor (Racing accessories)
- Calibration of height sensor (DDC–CAL)
- Engine speed for shift light ON (SFT–ON)
- Engine speed for shift light OFF (SFTOFF)
- Shift-light brightness (SFT–BR)
- Shift-light flash frequency (SFT–FL)
- Display layout in LAPTIMER mode (SETUP LAPTIMER)
- Display hold time for the most recent time (HOLD)
- Minimum lap time (LAP–TM)
- Activate or deactivate indicator for bulb defect (LAMP)
- Compare current lap with best lap (FSTLAP)
- Activate or deactivate speed warning (SPEED) in ROAD mode
- Display brightness (BRIGHT)
- Exit SETUP (SETUP RE–TURN)
Overview of SETUP mode

- Solid line: short-press the button.
- Broken line: press and hold down the button.

1. Selecting a parameter
2. Direct jump to ROAD mode
3. Setting parameters
4. Exiting SETUP mode

On the race track
Setting parameters

- Press and hold down button 2 until the parameter starts to flash.
- Repeatedly press button 1 or button 2 until the value you want appears on the display.
  When the value you want is shown:
  - Press and hold down button 2 until the value stops flashing.
  - The value is saved.

Exiting SETUP mode

- Press and hold down button 1 until the multifunction display switches to ROAD mode.
- A value that is still flashing will not be saved.
- Alternatively: Repeatedly press button 1 or button 2 until SETUP RETURN appears on the display.
  When “SETUP RETURN” is shown:
  - Press and hold down button 2 to exit the SETUP menu.
  - SETUP MENU appears on the display.

Adjusting damping, rear

On the race track
Adjusting compression damping on the rear suspension strut.

Adjusting damping, front

Without height sensor on the front wheel:
Adjust damping on the front suspension strut without separation of rebound and compression damping.

Without height sensor on the front wheel:
Adjust rebound damping on the front suspension strut.

On the race track
Without height sensor on the front wheel:
Adjust compression damping on the front suspension strut.

The separate adjustment of height sensors required for rebound and compression damping is not offered by BMW Motorrad. Available at racing accessory stockists.
You can request more detailed information by sending an email to "hp-race-support@bmw-motorrad.com".

Calibration of height sensor
Calibration of ride-height sensor on the rear suspension strut, e.g. after changes to the suspension height (☞ 101).

Engine speed for shift light ON
Engine speed for shift light ON in rpm.
Engine speed for shift light OFF

Engine speed for shift light OFF in rpm.
You can select only engine speeds that are higher than the shift light ON speed.

Shift-light brightness

Shift-light brightness expressed as a percentage of maximum brightness.
The shift light remains on while brightness is being adjusted and immediately adjusts to the selected brightness setting.

Shift-light flash frequency

Frequency at which the shift light and the speed warning flash, in Hz (1/s).
If you select ON, the shift light and the speed warning show continuously.

Display layout in laptimer mode

You can choose between six display layout versions for the laptimer mode.
On the race track

Version 1
The second line shows the running time for the current lap, the best lap saved in memory is shown in the third line.

Version 2
The second line shows the time recorded for the preceding lap, the running time for the current lap is shown in the third line.

Version 3
The second line shows the running time for the current lap, the all-time best lap is shown in the third line (➡ 86).
Version 4
The second line shows the time recorded for the preceding lap, the best lap saved in memory is shown in the third line.

Version 5
The second line shows the running time for the current lap, the third line is blank.

Version 6
The second line is blank, the third line shows the running time for the current lap.

On the race track
Display-freeze period for the most recent time

Freeze time in seconds. After the start of a new lap the time for the preceding lap remains visible for the selected period. When this freeze period expires the readout switches back to the running time for the current lap.

Minimum lap time

If an infrared receiver is used for timing laps, you can set the minimum time that must elapse from when the first signal is received until a second signal will be accepted. This prevents the signals from two or more transmitters in close proximity from being accepted for processing. Note too that within this time, pressing the headlight flasher button will not start timing for a new lap.

Indicator for bulb failure

If a bulb or the number-plate carrier is removed in preparation for a race-track session, the electronics detect a bulb failure and the appropriate warning appears on the display. This function suppresses this warning.
**Fastest lap indicator**

The "Fastest lap anticipated" function is switched on.

**Speed warning**

Activating this function activates another main menu in which you can set a top speed. A warning is issued if the motorcycle exceeds this limit.

**Display brightness**

You can set display brightness to any of five levels.
DTC

DTC setting
The DTC controls permissible rear-wheel slip in accordance with your selected riding mode. In the SLICK riding mode it is also possible to adapt the system-imposed DTC setting to suit personal preference.

DTC Adapting
- Activate SLICK mode; install coding plug, if necessary.
- This adaptation of the DTC setting is possible only in the SLICK riding mode.
- It is also possible to adjust the DTC settings while on the move.

- Press button 1 at the top (+) for earlier DTC intervention (less rear wheel slippage).
- It can be set to give a reading of between 1 and 7; 7 representing the earliest intervention.

- Press button 1 at the button (-) for later DTC intervention (more rear wheel slippage).
- The range of adjustment is from -1 to -7, with intervention at its latest at a setting of -7.

Risk of falling through rear wheel skidding. Reducing DTC can lead to rear wheelspin and thus loss of stability. Reduce DTC for riding on racing circuits only.

The reading you select is indicated by the symbol in the multifunction display 1.
In the gravel trap
On very loose surfaces (for example in a gravel trap of a race track), the DTC’s attempts to control propulsive power might reduce drive to the extent that the rear wheel no longer turns. Under these circumstances, BMW Motorrad recommends temporarily switching off DTC. Bear in mind that the rear wheel will spin on the loose surface and close the throttle in good time before you reach a firm surface. Then reactivate DTC.

DDC
DDC adjustment
Damping is automatically altered through the DDC system to suit the rider’s style of riding. The customisation of the system-based damping settings is also possible for the front wheel as well as for the rear wheel. Rebound and compression damping can be altered on the back wheel separately. To be able to also alter damping on the front wheel, a height sensor (available at racing accessory stockists) must be installed. You can obtain further information from HP Race Support by sending an email to hp-race-support@bmw-motorrad.com.

The customisation of damping settings must be separately performed for each riding mode.

Adjusting the damping characteristic for rear wheel
- Make sure the ground is level and firm and place the motorcycle on its stand.
- Switch to SETUP mode.
- To adjust compression damping, press buttons 1 and 2 as applicable until “DDC-RE” (DDC-REAR) is displayed at position 3 and “COM:” (Com-
pression) is displayed at position 4.
• To adjust rebound damping, press buttons 1 and 2 as applicable until DDC-RE (DDC-REAR) is displayed at position 3 and "REB:" (Rebound) is displayed at position 4.
• Hold down button 2 until the reading next to "REB:"/"COM:" flashes.
• Using buttons 1 and 2, adjust damping as desired.
  » +1 ... +7: Increase damping by a maximum of seven levels.
  » -1 ... -7: Reduce damping by a maximum of seven levels.
  » 0: Default settings.

Adjusting damping characteristic for front wheel
• Make sure the ground is level and firm and place the motorcycle on its stand.
• Switch to SETUP mode.

Without height sensor on the front wheel:
• To adjust damping, press buttons 1 and 2 as applicable until "DDC-FR" (DDC-FRONT) is displayed at position 3 and "DMP:" (Damping) is displayed at position 4.
• Press button 2 until the reading next to "DMP:" flashes.
• Using buttons 1 and 2, adjust damping as desired.
  » +1 ... +7: Increase damping by a maximum of seven levels.
  » -1 ... -7: Reduce damping by a maximum of seven levels.
  » 0: Default settings.

On the race track
tion 3 and REB: (Rebound) is displayed at position 4.

- Hold down button 2 until the reading next to "REB:"/"COM:" flashes.
- Using buttons 1 and 2, adjust damping as desired.
  » +1 … +7: Increase damping by a maximum of seven levels.
  » -1 … -7: Reduce damping by a maximum of seven levels.
  » 0: Default settings.

**Performing a zero position alignment**
- Place the motorcycle on the side stand or on a suitable auxiliary stand.
- During the alignment, do not sit on the motorcycle; remove pieces of luggage.

[Image]

- To calibrate, first press buttons 1 and 2 as applicable until "DDC" is displayed at position 3 and "CAL" (Calibration) is displayed at position 4.
- Then press and hold down button 2 until the "CAL" starts flashing.

[Image]

If the zero position alignment was successfully performed, a check mark is displayed.
If the check mark is not displayed:
- Repeat alignment.
- If the check mark is still not displayed after repeating the alignment, seek the advice of a specialist workshop, preferably an authorised BMW Motorrad dealer.

**Installing height sensor plugs**
- Remove the side panel (137).
Remove protective cap from plug and connect height sensor plug.

In the SETUP-menu, the damping on the front wheel can be adjusted separately from rebound and compressing damping.

Installing side panel (⇒ 138).

**Running gear**

**Height adjustment**

In order to customise the suspension height, the left and right slide blocks 1 can be replaced on the suspension strut screw joint.

Attached to the vehicle are two pairs of slide blocks with different drill holes. The blocks in each pair can be turned 180°, so together with the blocks installed ex-works there are five possible height settings (-3 mm, -1.5 mm, 0 mm, +1.5 mm, +3 mm):

- 1 slide blocks with a drill hole 3 mm off-centre.
- 2 slide blocks with a drill hole 1.5 mm off-centre; these are installed at the factory.
- 3 slide blocks with a central drill hole.
Adjusting height of suspension

- Lift the motorcycle using a suitable auxiliary stand to relieve pressure on the suspension strut.

- Remove screw 2 and remove sliding block 1.

- Remove slide block 3 on the right hand side.
- Select a pair of slide blocks according to the desired height.
- Adjust narrow threaded slide block 3 on the right hand side.
- Adjust wide recessed slide block 2 on the right hand side.
- Install screw 1 and tighten to specified torque.
- Performing a zero position alignment (⇒ 101).

Spring strut to relay lever

56 Nm
Racing start
Launch Control
Launch Control supports riders by maintaining ideal engine revving for a racing start. Launch Control can be activated only in SLICK mode. After Launch Control has been activated, the system maintains the engine speed at full throttle at approx. 8000 rpm. After engaging the clutch, torque is controlled, so that maximum drive is produced at the rear wheel. The throttle twistgrip remains in the full-load position. The limit on engine rpm is deactivated as soon as speed exceeds 60 km/h. While Launch Control is active, DTC is switched off.

Launch Control is also turned off in the following circumstances:

- The third gear is engaged.
- The angle of inclination is greater than 30°.
- The engine or the ignition is switched off.
- The riding mode is changed.

The number of consecutive starts using Launch Control is limited in order to protect the clutch. The number of possible starts still remaining is shown in the multifunction display.

Racing start with Launch Control

Risk of accident through increased acceleration. Launch Control permits maximum acceleration, so unfamiliar riding situations can occur. Use Launch Control only on race tracks.

- Activate the SLICK riding mode.
- Bring vehicle to starting position.
- Vehicle is stationary, engine is running.

Press and hold down starter button 1 until the reading on the display changes.
- Check the display.

On the race track
In the multifunction display, L-CON and the remaining number of available starts 1 using Launch Control are shown.

Start with Launch Control is possible.
- Start as described below.

If no start using Launch Control is currently possible, the number 0 is shown, alongside an exclamation mark 2.

Allow the clutch to cool.

<table>
<thead>
<tr>
<th>Cooling period for the clutch</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>approx. 3 min (when the engine is running)</td>
<td></td>
</tr>
<tr>
<td>approx. 20 min (when the engine is not running)</td>
<td></td>
</tr>
</tbody>
</table>

Proceed in the normal way when starting; open the throttle only as far as necessary to reach the rpm limit.
- After engaging the clutch, open the throttle completely.

If the DTC warning light shows, the DTC system has been switched off.

Shift light on.

» Launch Control controls ideal torque at the rear wheel and maintains a constant engine speed up to approx. 60 km/h.

» As soon as rpm limitation ceases, engine rpm increases because the throttle twistgrip is in the full-throttle position.
Removing and installing mirrors

Removing mirror

- Make sure the ground is level and firm and place the motorcycle on its stand.
- On each side, remove nuts 1 and remove the mirrors.
- Secure fairing 2 to fairing bracket 3 on left and right. If cable ties are used, affix adhesive tape as protection at the points where chafing might occur.
- Use the HP Race Cover Kit from BMW Motorrad to cover the screw holes and restore the secure fastening of the mount.

Installing mirrors

- Make sure the ground is level and firm and place the motorcycle on its stand.
- Remove the fairing-panel fasteners.
- Engage the left and right mirrors in mounts 4.
- Install the nuts at the rear of the fairing panel and tighten to specified torque.

<table>

On the race track
Removing and installing number-plate carrier

Removing number-plate carrier

- Switch off the ignition.
- Make sure the ground is level and firm and place the motorcycle on its stand.
  - with anti-theft alarm (DWA) OE
  - If applicable, deactivate the anti-theft alarm.<br>
  - with Passenger Bundle OE
  - Removing rear seat (16 56).

- Open cable tie 1 (can be reused).
- Open retainer 2 and disconnect the plug.
- Open retainers 3 and disconnect the plug.
- Remove screw 4.
- Work the anti-theft alarm forward out of the holder.
Carefully disengage anti-theft alarm bracket 5 from the rear frame and turn it up.

Open retainer 6 and disconnect the plug.

Use a small screwdriver to push retainer 7 to the left and at the same time push the plug to the rear and off the anti-theft alarm bracket.

Remove the anti-theft alarm bracket.

Protect the plug on the motorcycle to prevent the ingress of foreign matter.

Remove screws 8 with washers and remove the number-plate carrier. Work the cable through opening 9.

- with Passenger Bundle OE
- Installing rear seat (⇒ 56).

Installing number-plate carrier

- Make sure the ground is level and firm and place the motorcycle on its stand.
- with Passenger Bundle OE
- Removing rear seat (⇒ 56).
Hold the number-plate carrier in position and work the cable through opening 9.
- Install screws 8 with the washers.

Close the plug, making sure that retainer 2 engages, and secure it to the rear frame with cable tie 1.

On the race track

with anti-theft alarm (DWA) OE

Push the plug of the number-plate carrier onto the anti-theft alarm bracket, making sure that retainer 7 engages.

Connect the plug, making sure that retainer 6 engages.

Position anti-theft alarm bracket 5 in the rear frame.
From the front, work the anti-theft alarm into position in the holder.
- Install screw 4.
- Connect the plug, making sure that retainers 3 engage.

- with Passenger Bundle OE
- Installing rear seat (56).

Removing and installing front turn indicators

Removing front flashing turn indicator

The procedure described here for the right side apply applies by analogy to the left side panel.

- Remove screw 2 and remove the turn indicator. Work the cable through the fairing side panel.
- Protect the plug on the motorcycle to prevent the ingress of foreign matter.

- Unclip the turn-signal cable at position 1.
Engage the fairing side panel in mount 6 on the engine spoiler.

Seat the side panel in the rubber buffer at position 4.

Install screws 2.

Install screws 3 with the washers.

Install screw 1.

Hold slipstream deflector 2 in position, making sure that it is the correct part for the side of the motorcycle on which you are working.

The letter "R" for right or "L" for left is stamped on the back of the slipstream deflector.

Install screws 1.

Installing front flashing turn indicator

Make sure the ground is level and firm and place the motorcycle on its stand.

Remove screws 1 and remove slipstream deflector 2.
Remove screw 1 on the inboard side of the right side panel.

Remove screws 2.
Remove screws 3 with the washers.

Pull the fairing side panel at position 4 to disengage it from the rubber buffer and remove.

Work the cable through the fairing side panel.

Hold the flashing turn indicator in position and install screw 2.

Clip in the turn-signal cable at position 1.
Installing side panel (⇒ 138).

bmw-motorrad.com/technology

Riding mode
Selection
Four ride modes enable the motorcycle’s characteristics to adapt to the prevailing weather conditions, the road and traffic, and the rider’s style of riding:
- RAIN
- SPORT (standard mode)
- RACE
- SLICK (only with coding plug inserted).

- with reduced power output, 79 kW GE

The following applies to motorcycles with power reduction: Once the coding plug has been inserted, the choice of riding modes includes SPORT and RACE with increased engine power.
Adapt your style of riding accordingly to allow for the markedly more sporty handling and performance with considerably more engine power.
It is important for the rider intending to use these more sporty ride modes to familiarise himself/herself with their characteristics.

⚠️ The following applies to motorcycles with power reduction: Inserting the coding plug voids homologation for riding the motorcycle on public roads.
Do not use the coding plug for riding these vehicles on public roads.
Each of these modes produces perceptible differences in the way the motorcycle behaves. ABS and/or DTC can be switched off in each mode: the explanations below invariably apply to the behaviour of the motorcycle with these systems active. The mode last selected is automatically reactivated after the ignition has been switched off and then on again. However, the ABS and/or DTC systems remain deactivated only if the coding plug is inserted.
The RAIN, SPORT and RACE modes are set up for riding with standard tyres recommended by BMW Motorrad. The SLICK mode is for racing slicks and surfaces with a very high level of grip.
Consequently, you must always bear the following in mind with regard to your selection of a ride mode: the sportier the setting, the greater the challenge to your riding skill!
RAIN
The increase in torque is linear. The ABS system always intervenes early enough to prevent as effectively as possible the wheels from locking and the rear wheel from lifting off the ground. The DTC system intervenes early enough to prevent the rear wheel from spinning whenever possible. The DDC system is set up for reserved driving.

SPORT
The behaviour of the ABS is the same as in RAIN mode. The DTC system intervenes later than in RAIN mode, so it is possible to induce slight drift when exiting corners. The behaviour of the DDC is the same as in RAIN mode.

RACE
RACE is the sportiest mode available without the coding plug inserted. In this mode, the ABS intervenes later. It still prevents the wheels from locking, but the function that detects the tendency of the rear wheel to lift clear of the ground is deactivated. The rear wheel can lift clear of the ground.

Risk of rollover, because the rear wheel lift-off protection system is switched off. When braking sharply, be prepared for the rear wheel lifting off the ground.

The DTC system intervenes even later than in the other modes, so lengthy drifts and wheelies are possible when exiting corners (at bank angles less than 25°). The DDC system is set up for a sporty riding style.

SLICK
The SLICK mode cannot be activated unless the coding plug is inserted. The SLICK mode was developed for situations in which the rider has an open view of the road ahead and the surroundings and is riding on surfaces with the high level of grip generally encountered only on race tracks. Similarly, the assumption on which the parameter settings for this mode are based is that the motorcycle is fitted with racing slicks with a very high level of dry-surface grip.

Engine power, power increase and throttle response are all set up for maximum sportiness. The behaviour of the ABS system in SLICK mode is derived from the IDM international German championship. It also differs from RACE mode in that the ABS does not...
intervene when the footbrake lever is depressed to apply the rear brake. Under these circumstances, the rear wheel can lock up. The function for detecting the rear wheel's tendency to lift clear of the ground is also deactivated.

⚠️ Risk of rollover, because the rear wheel lift-off protection system is switched off. When braking sharply, be prepared for the rear wheel lifting off the ground.

⚠️ Risk of accident, because ABS on the rear wheel is switched off. Be prepared during hard breaking for the rear wheels to lock.

When this mode is selected the controller of the DTC system assumes that the motorcycle is running on racing tyres with maximum grip (slicks). Long wheelies are possible and the same applies to wheelies at slight angles of heel, and it is important to bear in mind that under these circumstances it is also possible that the motorcycle might flip over backwards! The behaviour of the DDC is the same as in RACE mode.

**Mode changes**

A changeover of the functions in the engine management system and the ABS and DTC systems while riding is possible only in certain operating states:

- No drive torque at the rear wheel
- No brake pressure in the brake system.

In order to achieve this state,

- The motorcycle must be at a standstill with the ignition switched on
- The throttle twistgrip must be in the fully closed position
- The brake levers must be in the released positions
- The clutch lever must be pulled and the clutch disengaged.

The desired riding mode is initially preselected. The mode change does not take place until the systems in question are all in the appropriate state. The selection menu does not disappear from the display until the mode change has taken place.
Brake system with BMW Motorrad Race ABS

Partially integral brakes
Your motorcycle is equipped with partially integral brakes. Both front and rear brakes are applied when you pull the handbrake lever. The footbrake lever acts only on the rear brake.

The integral braking function makes it very difficult to spin the rear wheel by opening the throttle with the front brake applied to keep the motorcycle stationary (Burn Out). Attempted burn-outs can result in damage to the rear brake and the clutch. Do not attempt a Burn Out unless the ABS function has been switched off.

How does ABS work?
The amount of braking force that can be transferred to the road depends on factors that include the coefficient of friction of the road surface. Loose stones, ice and snow or a wet road all have much lower coefficients of friction than a clean, dry asphalt surface. The lower the coefficient of friction, the longer the braking distance.

If the rider increases braking pressure to the extent that braking force exceeds the maximum transferable limit, the wheels start to lock and the vehicle loses its directional stability; a fall is imminent. Before this situation can occur, ABS intervenes and adapts braking pressure to the maximum transferable braking force, so the wheels continue to turn and directional stability is maintained irrespective of the condition of the road surface.

What are the effects of surface irregularities?
Humps and surface irregularities can cause the wheels to lose contact temporarily with the road surface; if this happens the braking force that can be transmitted to the road can drop to zero. If the brakes are applied under these circumstances, the ABS has to reduce braking force to ensure that directional stability is maintained when the wheels regain contact with the road surface. At this instant, the BMW Motorrad Integral ABS must assume an extremely low coefficient of friction, so that the wheels will continue to rotate under all imaginable circumstances, because this is the precondition for ensuring directional stability. As soon as it registers the actual circumstances, the system reacts instantly and adjusts brak-
What feedback does the rider receive from the BMW Motorrad Race ABS?

If the ABS system has to reduce braking force on account of the circumstances described above, vibration is perceptible through the handbrake lever. When the handbrake lever is pulled, brake pressure is also built up at the rear wheel by the integral function. If the brake pedal is depressed after the handbrake lever is pulled, the brake pressure built up beforehand is perceptible as counter-pressure sooner than is the case when the brake pedal is depressed either before or at the same time as the brake lever is pulled.

Rear wheel lift

Even under severe braking, a high level of tyre grip can mean that the front wheel does not lock up until very late, if at all. Consequently, ABS does not intervene until very late, if at all. Under these circumstances the rear wheel can lift off the ground, and the outcome can be a high-siding situation in which the motorcycle can flip over.

Special situations

The speeds of the front and rear wheels are compared as one means of detecting a wheel’s incipient tendency to lock. If the system registers implausible values for a lengthy period, the ABS function is deactivated for safety reasons and an ABS fault message is issued. Self-diagnosis has to complete before fault messages can be issued.

In addition to problems with the BMW Motorrad Race ABS, exceptional riding conditions can lead to a fault message being issued.

Exceptional riding conditions:

- Heating up with the motorcycle on an auxiliary stand, in neutral or with a gear engaged.
- Rear wheel locked by the engine brake for a lengthy period, for example while descending steep gradients.
If a fault message is issued on account of exceptional riding conditions as outlined above, you can reactivate the ABS function by switching the ignition off and on again.

**What significance devolves on regular maintenance?**

Invariably, a technical system cannot perform beyond the abilities dictated by its level of maintenance. In order to ensure that the BMW Motorrad Race ABS is always maintained in optimum condition, it is essential for you to comply strictly with the specified inspection intervals.

**Reserves for safety**

The potentially shorter braking distances which BMW Motorrad Race ABS permits must not be used as an excuse for careless riding. ABS is primarily a means of ensuring a safety margin in genuine emergencies. Take care when cornering! When you apply the brakes on a corner, the motorcycle’s weight and momentum take over and even BMW Motorrad Race ABS is unable to counteract their effects.

**Evolution of Race ABS to ABS Pro**

– with ABS Pro OA

Until now, the BMW Motorrad Race ABS of the HP4 helped ensure a very high degree of safety for braking with the motorcycle upright and travelling in a straight line. Now ABS Pro offers enhanced safety for braking in corners as well. ABS Pro prevents the wheels from locking even under sharp braking. ABS Pro reduces abrupt changes in steering force, particularly in panic-braking situations, countering the vehicle’s otherwise natural but undesirable tendency to straighten up.

**ABS intervention**

Technically speaking, depending on the riding situation ABS Pro adapts ABS intervention to the motorcycle's bank angle. Signals for rate of roll and rate of yaw and lateral acceleration are used to calculate bank angle. These signals come from the angular rate sensor, an integral component of Dynamic Traction Control DTC and Dynamic Damping Control DDC. As the motorcycle is heeled over more and more as it banks into a corner, an increasingly strict...
limit is imposed on the brake-pressure gradient for the start of brake application. This slows the build-up of brake pressure to a corresponding degree. Additionally, pressure modulation is more uniform across the range of ABS intervention.

Advantages for the rider
The advantages of ABS Pro for the rider are sensitive response and high braking and directional stability combined with best-case deceleration of the motorcycle, even when cornering.

ABS Pro is available only in the RAIN and SPORT riding modes.

Electronic engine management with BMW Motorrad DTC

How does the DTC work?
The BMW Motorrad DTC system compares the speed of rotation of the front wheel and the rear wheel. The differential is used to compute slip as a measure of the reserves of stability available at the rear wheel. If slip exceeds a certain limit, the engine control intervenes and adapts the engine torque accordingly.

Even DTC is constrained by the laws of physics. Invariably, the rider bears responsibility for assessing road and traffic conditions and adopting his or her style of riding accordingly.

Do not take risks that would negate the additional safety offered by this system.
sequently, there can be a perceptible reduction in acceleration out of very tight bends.

The speeds of the front and rear wheels are compared and the angle of heel taken into account as one means of detecting the rear wheel's incipient tendency to spin or slip sideways. If the electronic processor receives values that it considers implausible over a lengthy period, a dummy value is used for the angle of heel or the DTC function is switched off. Under these circumstances the indicator for a DTC fault shows. Self-diagnosis has to complete before fault messages can be issued.

The BMW Motorrad DTC can switch off automatically under the exceptional riding conditions outlined below.

**Exceptional riding conditions:**

- Riding for a lengthy period with the front wheel lifted off the ground (wheelie) with DTC deactivated.
- Rear wheel rotating with the vehicle held stationary by applying the front brake (burn-out).
- Heating up with the motorcycle on an auxiliary stand, in neutral or with a gear engaged.

If the coding plug for the SLICK mode is not inserted, you can reactivate DTC by switching the ignition off and then on again and accelerating to a speed in excess of 5 km/h.

If the front wheel lifts clear of the ground under severe acceleration, the DTC reduces engine torque until the front wheel regains contact with the ground. In the RACE and SLICK riding modes, wheelies at slight bank angles are possible.

Under these circumstances, BMW Motorrad recommends rolling the throttle slightly closed so as to restore stability with the least possible delay.

When riding on a slippery surface, never snap the throttle twistgrip fully closed without pulling the clutch at the same time. Engine braking torque can cause the rear wheel to skid, with a corresponding loss of stability. The BMW Motorrad DTC is unable to control a situation of this nature.
BMW Motorrad
Dynamic Damping Control

DDC

Movement of the rear spring strut is registered by the ride height sensor. The electric damper valve is opened/closed depending on the determined direction of travel and speed of travel as well as on the chosen ride mode. Front-wheel damping also depends on the riding mode, but spring travel is not measured. The damping values for the front wheel and for the back wheel can be changed in the SETUP menu either to one of seven levels to make the damping "softer" or one of seven levels to make the damping "harder". Rebound and compression damping can be altered on the back wheel separately.

In order to be able to separately customise rebound and compression damping on the front wheel, a height sensor must be installed on the suspension fork. A connecting plug for the sensors is already present on the motorcycle; it can be found under the left side panel. If an additional height sensor has been installed, an existing sensor replaced or the suspension height changed, a calibration must be performed. The calibration is begun in SETUP menu.
Accessories

General instructions ............... 124

General instructions

BMW Motorrad cannot examine or test each product of outside origin to ensure that it can be used on or in connection with BMW motorcycles without constituting a safety hazard. Country-specific official authorisation does not suffice as assurance. Tests conducted by these instances cannot make provision for all operating conditions experienced by BMW motorcycles and, consequently, they are not sufficient in some circumstances. Use only parts and accessories approved by BMW for your motorcycle.

BMW has conducted extensive testing of the parts and accessory products to establish that they are safe, functional and suitable. Consequently, BMW accepts product liability.

accepts no liability whatsoever for parts and accessories that it has not approved.

Whenever you are planning modifications, comply with all the legal requirements. Make sure that the vehicle does not infringe the national road-vehicle construction and use regulations applicable in your country.

Your BMW Motorrad dealer can offer expert advice on the choice of genuine BMW parts, accessories and other products.

To find out more about accessories go to: bmw-motorrad.com/accessories

Rear footrests

Removing rear footrests

– with Passenger Bundle

• Remove screws 1 and nuts 2.

• Removing washers and rear footrests.

• Remove screws 1 and stretch out the silencer strap, pulling backwards from the silencer.
Hold the silencer strap and install screw 1 (M8x30), tightening to the specified torque.

Carbon fiber bracket (silencer) on the rear frame 28 Nm

Stretch out retaining strap 1 and pull backwards over the silencer.
Adjust retaining strap and silencer - make sure that the retaining strap is lying flat against the external side of the silencer bracket.
Insert screw 2 into washer, retaining band, silencer strap, second washer and nut and tighten to the specified tightening torque.

Remove screws 1.
Remove rear footrests.

Silencer clamp on bracket 20 Nm
Install screw hole covers 1.

Cover for rear footrests on the rear frame
- without Passenger Bundle OE
  3 Nm<

Installing rear footrests
- with Passenger Bundle OE

- Remove screw 2 with nut and washers.
- Stretch out retaining strap 1 and pull backwards from the silencer.

- Remove screws 1 and remove the silencer strap.

- Hold the footrest and install screw 1 (M8x25), tightening to the specified torque.
Rear footrest holder to rear frame
28 Nm

Stretch out retaining strap 1 and pull backwards over the silencer.
Align the retaining strap and silencer; slip the washer, retaining strap and second washer on to the footrest screw.
Install nut 2, but do not tighten it at this point.
Install screw 3.

Tighten nut 2 to the specified tightening torque.

Silencer clamp on bracket
20 Nm

Hold footrest.
Install screws 1 and tighten to the specified tightening torque.

Rear footrest holder to rear frame
28 Nm

BMW Motorrad ABS Pro
– with ABS Pro OA

Ever since it introduced Race ABS, BMW Motorrad has been able to offer ABS tailored to the specific needs and preferences of supersport riders. ABS Pro is an evolved functionality.
based on Race ABS; it enables ABS-assisted braking as a function of bank angle with the vehicle heeled over for cornering. ABS Pro is an all-software update of the ABS control unit and the KOMBI control unit of the instrument panel. ABS Pro is an optional accessory and can be obtained through and retrofitted by your authorised BMW Motorrad dealer.

ABS Pro cannot be retrofitted in combination with the HP Race Power Kit and/or the HP Race Calibration Kit.

General instructions

The Maintenance chapter describes straightforward procedures for checking and replacing certain wear parts. Special tightening torques are listed as applicable. The tightening torques for the threaded fasteners on your vehicle are listed in the section entitled "Technical data". You will find information on more extensive maintenance and repair work in the Repair Manual on DVD for your vehicle, which is available from your authorised BMW Motorrad dealer.

Some of the work calls for special tools and a thorough knowledge of the technology involved. If you are in doubt, consult a specialist workshop, preferably your authorised BMW Motorrad dealer.

Toolkit

1. Spare fuses with puller tool
   - Miniature fuses, 4 A and 7.5 A
2. Ring spanner
   - Width across flats 34
   - Adjust the chain tension (142).
3. Socket wrench
   - Width across flats 17
   - Adjusting spring preload for front wheel (52).
   - Adjusting spring preload for rear wheel (53).
   - Use plastic tops when adjusting the front and rear spring preloads respectively.
4. Extension for hook wrench
5. Socket wrench
   - T25
   - Removing and installing body panels
6. Plastic adapter for socket wrench
   - Adjusting spring preload for front wheel (52).
7. Plastic adapter for socket wrench
   - Adjusting spring preload for rear wheel (53).
8. Extension for screwdriver blade
8 Open-ended spanner
   Width across flats 10/13
   – Adjust the chain tension (p. 142).
9 Reversible-blade screwdriver with star-head and plain tips
   – Remove the battery (p. 162).
10 Reversible screwdriver blade
    Phillips PH1 and Torx T25
    – Remove the front seat (p. 57).
    – Removing and installing body panels
    – Replacing bulbs for front and rear turn indicators (p. 157).

Engine oil
Checking engine oil level

⚠️ The oil level varies with the temperature of the oil. The higher the temperature,
the higher the level of oil in the sump. Checking the oil level with the engine cold or after no more than a short ride will lead to misinterpretation of oil level.

In order to ensure that the engine oil level is read correctly, check the oil level only after at engine operating temperature.

- Make sure the engine is at operating temperature and hold the motorcycle upright.
- Allow the engine to idle for one minute.
- Switch off the ignition.

Check the oil level in oil-level indicator 1.

Engine oil, specified level between MIN and MAX marks.
SAE 5W-40, API SL / JASO MA2, Additives (e.g. molybdenum-based) are not permissible because they can attack coated components of the engine. BMW Motorrad recommends the use of BMW Motorrad oils, obtainable from your authorised BMW Motorrad dealer.

**Engine oil, capacity**
- approx. 3.5 l (with filter change)

**Engine oil, quantity for topping up**
- max 0.8 l (Difference between MIN and MAX)

If the oil level is below the MIN mark:
- Topping up the engine oil (→ 132).

If the oil level is above the MAX mark:
- Have the oil level corrected by a specialist workshop, preferably an authorised BMW Motorrad dealer.

**Topping up the engine oil**
- Make sure the ground is level and firm and place the motorcycle on its stand.
- Wipe the area around the oil filler neck clean.

- Remove cap 1 of the oil filler neck.
- Damage to the engine can result if it is operated without enough oil, but the same also applies if the oil level is too high.
- Always make sure that the oil level is correct.
- Top up the engine oil to the specified level.
- Checking engine oil level (→ 131).
- Install oil filler cap 1.

**Brake system**

**Checking function of brakes**
- Pull the front brake lever.
  - The pressure point must be clearly perceptible.
- Press the footbrake lever.
  - The pressure point must be clearly perceptible.
If pressure points are not clearly perceptible:

> Incorrect working practices endanger the reliability of the brakes.

Have all work on the brake system undertaken by trained and qualified specialists.

- Have the brakes checked by a specialist workshop, preferably an authorised BMW Motorrad dealer.

Checking front brake pad thickness

- Make sure the ground is level and firm and place the motorcycle on its stand.
- Turn the handlebars to the full-lock position.

> Visually inspect the left and right brake pads to ascertain their thickness. Viewing direction: from the rear toward brake pads 1.

- Brake-pad wear limit, front
  min 0.8 mm (Friction pad only, without backing plate)

If the brake pads are worn:

> Brake pads worn past the minimum permissible thickness can cause a reduction in braking efficiency and under certain circumstances they can cause damage to the brake system.

In order to ensure the dependability of the brake system, do not permit the brake pads to wear
past the minimum permissible thickness.

- Have the brake pads replaced by a specialist workshop, preferably an authorised BMW Motorrad dealer.

Checking rear brake pad thickness

- Make sure the ground is level and firm and place the motorcycle on its stand.

  Viewing direction: from the rear toward brake pads 1.

- Visually inspect the brake pads to ascertain their thickness.

Brake-pad wear limit, rear
min 1.0 mm (Friction pad only, without backing plate)

If the wear indicating mark is no longer visible:

- Brake pads worn past the minimum permissible thickness can cause a reduction in braking efficiency and under certain circumstances they can cause damage to the brake system.

In order to ensure the dependability of the brake system, do not permit the brake pads to wear past the minimum permissible thickness.

- Have the brake pads replaced by a specialist workshop, preferably an authorised BMW Motorrad dealer.

Checking brake-fluid level, front brakes

- Make sure the ground is level and firm and hold the motorcycle upright.
- Move the handlebars to the straight-ahead position.
Check the brake fluid level in brake fluid reservoir 1.

Wear of the brake pads causes the brake fluid level in the reservoir to sink.

It is impermissible for the brake fluid level to drop below the MIN mark. (Brake-fluid reservoir horizontal)

If the brake fluid level drops below the permitted level:

A low fluid level in the brake reservoir can allow air to penetrate the brake system. This significantly reduces braking efficiency.

Check the brake-fluid level at regular intervals.

Have the defect rectified as quickly as possible by a specialist workshop, preferably an authorised BMW Motorrad dealer.

Checking the brake-fluid level, rear brakes

Make sure the ground is level and firm and hold the motorcycle upright.
Check the brake fluid level in rear reservoir 1.

Wear of the brake pads causes the brake fluid level in the reservoir to sink.

Brake fluid level, rear
Brake fluid, DOT4

It is impermissible for the brake fluid level to drop below the MIN mark. (Brake-fluid reservoir horizontal)

If the brake fluid level drops below the permitted level:

A low fluid level in the brake reservoir can allow air to penetrate the brake system. This significantly reduces braking efficiency.

Check the brake-fluid level at regular intervals.

Have the defect rectified as quickly as possible by a specialist workshop, preferably an authorised BMW Motorrad dealer.

Coolant

Checking coolant level

Make sure the ground is level and firm and place the motorcycle on its stand.

Check the coolant level in expansion tank 1. Viewing direc-
Coolant, specified level
Between MIN and MAX marks on the expansion tank (Engine cold)

If the coolant drops below the permitted level:
- Top up the coolant.

**Topping up coolant**
- Remove the side panel (138).

Body panels
Remove the side panel
The procedure described here for the right side applies by analogy to the left side panel.
- Make sure the ground is level and firm and place the motorcycle on its stand.
- Open cap 1 of the expansion tank.
- Top up coolant to specified level.
- Checking coolant level (136).
- Close the cap of the expansion tank.
- Installing side panel (138).
- Remove screws 1 and remove slipstream deflector 2.
1. Remove screw 1 on the in-board side of the side panel.

2. Remove screws 2.
3. Remove screws 3 with the washers.

4. Pull the fairing side panel at position 4 to disengage it from the rubber buffer and remove.

5. Disconnect plug 5.
6. Engage the fairing side panel in mount 6 on the engine spoiler.

7. Remove the side panel.

8. Connect plug 5.
• Seat the side panel in the rubber buffer at position 4.
• Install screws 3 with the washers.
• Install screws 2.

• Install screw 1.

• Hold slipstream deflector 2 in position, making sure that it is the correct part for the side of the motorcycle on which you are working.
  » The letter "R" for right or "L" for left is stamped on the back of the slipstream deflector.
• Install screws 1.

Clutch
Checking clutch function
• Pull the clutch lever.
  » The pressure point must be clearly perceptible.

If the pressure point is not clearly perceptible:
• Have the clutch checked by a specialist workshop, preferably an authorised BMW Motorrad dealer.

Checking clutch-lever play
• Pull clutch lever 1 until resistance is perceptible.
Pull clutch lever 2 until resistance is perceptible.

In this position, measure clutch play between the handlebar fitting and the clutch lever.

Clutch lever play

0.5...1.0 mm (at the handlebar fitting, with engine cold)

Clutch play is out of tolerance:
- Adjust the clutch-lever play (→ 140).

To increase clutch play: turn screw 1 in the tightening direction, i.e. into the handlebar fitting.
To reduce clutch play: turn screw 1 in the loosening direction, i.e. out of the handlebar fitting.

Checking clutch-lever play (→ 139).
Repeat the steps in this procedure until clutch play is set correctly.
Rims and tyres

Checking rims
- Make sure the ground is level and firm and place the motorcycle on its stand.
- Visually inspect the rims for defects.
- Have any damaged rims inspected by a specialist workshop and replaced if necessary, preferably by an authorised BMW Motorrad dealer.

Check the tyre tread depth
- Your motorcycle’s handling and grip can be impaired even before the tyres wear to the minimum tyre tread depth permitted by law.
- Have the tyres changed in good time before they wear to the minimum permissible tread depth.

- Make sure the ground is level and firm and place the motorcycle on its stand.
- Measure the tyre tread depth in the main tread grooves with wear marks.

Wear indicators are built into the main profile grooves on each tyre. The tyre is worn out when the tyre tread has worn down to the level of the marks. The locations of the marks are indicated on the edge of the tyre, e.g. by the letters TI, T2I or by an arrow.

If the tyre tread is worn to minimum:
- Replace tyre or tyres, as applicable.

Chain

Lubricating chain
- Dirt, dust and inadequate lubrication will result in accelerated wear and significantly shorten the drive chain’s useful life.

- Clean and lubricate the drive chain at regular intervals.

- Lubricate the drive chain every 800 km at the latest. Lubricate the chain more frequently if the motorcycle is ridden in wet, dusty or dirty conditions.

- Switch the ignition off and select neutral.

- Clean the drive chain with a suitable cleaning product, dry it and apply chain lubricant.

- To prolong chain life, BMW Motorrad recommends the use of BMW Motorrad chain lubricant, or:
Lubricant

Chain spray

• Wipe off excess lubricant.

Checking chain tension

• Make sure the ground is level and firm and place the motorcycle on its stand.
• Turn the rear wheel until it reaches the position with the lowest amount of chain sag.

Use a screwdriver to push the chain up and down at a point midway along the run between pinion and sprocket and measure difference a.

<table>
<thead>
<tr>
<th>Chain deflection</th>
</tr>
</thead>
<tbody>
<tr>
<td>40...50 mm (Motorcycle with no weight applied, supported on its side stand)</td>
</tr>
</tbody>
</table>

If measured value is outside permitted tolerance:

• Adjust the chain tension (⇒ 142).

Adjust the chain tension

• Make sure the ground is level and firm and place the motorcycle on its stand.

Slacken quick-release axle nut 1.
Slacken locknuts 3 on left and right.
Use adjusting screws 2 on left and right to adjust chain tension.
Checking chain tension (⇒ 142).
Make sure that scale readings 4 are the same on left and right.
Tighten locknuts 3 on left and right to the specified tightening torque.
Locknut of the final-drive chain tensioning screw

19 Nm

- Tighten quick-release axle nut 1 to the specified tightening torque.

Rear quick-release axle in swinging arm

Thread-locking compound: mechanical

100 Nm

Checking the chain wear

- Engage 1st gear.
- Turn the rear wheel in the normal direction of travel until the chain is tensioned.
- Measure chain length underneath the rear wheel swinging arm.

Permissible chain length

max 144.30 mm (measured centre to centre over 10 pins, chain pulled taut)

If the chain has stretched to the maximum permissible length:
- Seek the advice of a specialist workshop, preferably an authorised BMW Motorrad dealer.

Wheels

Tyre recommendation

For each size of tyre, BMW Motorrad tests and classifies as roadworthy certain makes. BMW Motorrad cannot assess the suitability or provide any guarantee of road safety for other tyres.

BMW Motorrad recommends using only tyres tested by BMW Motorrad. Detailed information is available from your authorised BMW Motorrad dealer or in the internet at: www.bmw-motorrad.com

Effect of wheel size on chassis and suspension control systems

Wheel size is very important as a parameter for the frame and suspension control systems ABS and DTC. In particu-
lar, the diameter and the width of a vehicle's wheels are programmed into the control unit and are fundamental to all calculations. Any change in these influencing variables, caused for example by a switch to wheels other than those installed ex-works, can have serious effects on the performance of the control systems. The sensor rings are essential for correct road-speed calculation, and they too must match the motorcycle's control systems and consequently cannot be changed.

If you decide that you would like to fit non-standard wheels to your motorcycle, it is very important to consult a specialist workshop beforehand, preferably an authorised BMW Motorrad dealer. In some cases, the data programmed into the control units can be changed to suit the new wheel sizes.

**Removing front wheel**

- Make sure the ground is level and firm and place the motorcycle on its stand.

- Remove screw **1** and remove the wheel-speed sensor from its bore.

- Mask off the parts of the wheel rim that could be scratched in the process of removing the brake calipers.

- Remove screws **2** of the brake calipers on left and right.

- Once the calipers have been removed, there is a risk of the brake pads being pressed together to the extent that they cannot be slipped back over the brake disc on reassembly. Do not operate the handbrake lever when the brake calipers have been removed.
Force the brake pads slightly apart by rocking brake caliper back and forth against brake disc. Carefully pull the brake calipers back and out until clear of the brake discs.

Place the motorcycle on an auxiliary stand. BMW Motorrad recommends the BMW Motorrad rear-wheel stand.

Carefully pull the brake calipers back and out until clear of the brake discs. Lift the front of the motorcycle until the front wheel is clear of the ground, preferably using a BMW Motorrad front-wheel stand.

The axle clamping screws on the left side of the vehicle locate the threaded bush in the front suspension. In order to ensure that the threaded bush remains correctly aligned, do not slacken or remove the axle clamping screws on the left side of the vehicle.

Always have the security of the fasteners checked by a specialist workshop. Threaded fasteners not tightened to the specified torque can work loose or their threads can suffer damage. Threaded fasteners not tightened to the specified torque can work loose or their threads can suffer damage. Always have the security of the fasteners checked by a specialist workshop, preferably an authorised BMW Motorrad dealer.

Possible malfunctions when ABS and DTC systems intervene if non-standard wheels are installed. See the information on the effect of wheel size on the ABS and DTC systems at the start of this chapter.

Threaded fasteners not tightened to the specified torque can work loose or their threads can suffer damage. Always have the security of the fasteners checked by a specialist workshop, preferably an authorised BMW Motorrad dealer.

Installing front wheel

Possible malfunctions when ABS and DTC systems intervene if non-standard wheels are installed. See the information on the effect of wheel size on the ABS and DTC systems at the start of this chapter.

Threaded fasteners not tightened to the specified torque can work loose or their threads can suffer damage. Always have the security of the fasteners checked by a specialist workshop, preferably an authorised BMW Motorrad dealer.

Maintenance
The front wheel must be installed right way round to rotate in the correct direction. Note the direction-of-rotation arrows on the tyre or the wheel rim.

- Roll the front wheel into position between the front forks.

- Raise the front wheel, insert quick-release axle 2 and tighten to specified torque.

- Tighten right axle clamping screws 1 to the specified tightening torque.

- Clamping screws in axle holder

  Tightening sequence: Tighten screws six times in alternate sequence

  19 Nm

- Ease the brake calipers on to the brake discs.

- Tighten screws 2 on left and right to the specified tightening torque.

- Radial brake caliper to axle mount

  38 Nm

- Remove the front-wheel stand and the auxiliary stand.
Insert the ABS sensor into its bore and install screw 1.
Remove the adhesive tape from the wheel rim.
Firmly pull the handbrake lever until the pressure point is perceptible, and repeat this operation several times.

Removing rear wheel
Place the motorcycle on an auxiliary stand; BMW Motorrad recommends the BMW Motorrad rear-wheel stand.
Installing rear-wheel stand (⇒ 152).

Slip wooden chocks or similar under the rear wheel to prevent it from dropping out after the quick-release axle has been removed.

Remove axle nut 1 with washer.
Slacken locknuts 3 on left and right.
Slacken adjusting screws 2 on left and right.
Remove adjusting plate 4 and push the axle in as far as it will go.

Remove quick-release axle 5 and remove adjusting plate 6.

Roll the rear wheel as far forward as possible and disengage chain 7 from the sprocket.
Remove the brake line and ABS line from holder 8.

When rolling the rear wheel clear of the motorcycle, take care not to damage wheel-speed sensor 9.

Roll the rear wheel to the rear and clear of the swinging arm and at the same time pull brake-caliper carrier 10 back far enough to allow the rear wheel to clear it.

The sprocket and the spacer sleeves on left and right are loose fits in the wheel. Make sure that these parts are not damaged or lost on removal.

Install the rear wheel

Possible malfunctions when ABS and DTC systems intervene if non-standard wheels are installed. See the information on the effect of wheel size on the ABS and DTC systems at the start of this chapter.

Threaded fasteners not tightened to the specified torque can work loose or their threads can suffer damage. Always have the security of the fasteners checked by a specialist workshop, preferably an authorised BMW Motorrad dealer.

Roll the rear wheel on the support into the swinging arm as far as necessary to permit the brake-caliper carrier to be inserted.
• Insert the brake-caliper carrier into the guide 11.

• Roll the rear wheel further into the swinging arm, while pushing brake-caliper carrier 10 forward at the same time.

• Roll the rear wheel as far forward as possible and loop chain 7 over the sprocket.

• Insert right adjusting plate 6 into the swinging arm with stop 12 to the front.

• When rolling the rear wheel into position, take care not to damage wheel-speed sensor 9.
• Lift the rear wheel and work quick-release axle 5 through the adjusting plate and into the brake-caliper carrier and the rear wheel.
• Make sure that the quick-release axle is seated against the stop of the adjusting plate.

Insert left adjusting plate 4.
• Install axle nut 1 with its washer, but do not tighten the nut at this point.

Seat the brake line and the ABS line in holder 8.
• Adjust the chain tension (142).

Front-wheel stand
Installing the front-wheel stand

The BMW Motorrad front wheel stand is not designed to support motorcycles not fitted with a centre stand or without other auxiliary stands. A motorcycle resting only on the front wheel stand and the rear wheel can topple. Place the motorcycle on its centre stand or another auxiliary stand before lifting the front wheel with the BMW Motorrad front-wheel stand.

• Place the motorcycle on an auxiliary stand; BMW Motorrad recommends the BMW Motorrad rear-wheel stand.
• Installing rear-wheel stand (152).
• Use basic stand (83 30 0 402 241) with the adapters (83 30 2 152 839).

• Insert adapter pins (83 30 2 152 840) 1 into the front suspension on left and right.

• Turn brackets 2 with long ends facing inwards.
  • Adjust adapters 3 to the width of the pins inserted in the front suspension.
  • Set the height of the front-wheel stand to raise the front wheel slightly clear of the ground.

• Engage the front-wheel stand in the front suspension and apply even pressure to push it down to the ground.
Rear-wheel stand  
Installing rear-wheel stand

- Use basic stand with tool number (83 30 0 402 241) and adapters (83 30 2 152 839).

1. Install adapter pins (83 30 2 152 841) 1 in the rear wheel swinging arm on left and right and tighten to the specified torque.

2. Swinging-arm adapter to rear wheel swinging arm
   20 Nm

3. Turn brackets 2 long ends out.
4. Adjust adapters 3 to the width of the pins inserted in the rear wheel swinging arm.
5. Set the height of the rear-wheel stand to raise the rear wheel slightly clear of the ground.
• Engage the rear-wheel stand in the rear wheel swinging arm and apply even pressure to push it down to the ground.

Lighting
Replacing bulbs for low-beam and high-beam headlight

The positions of the plug, the spring wire retainer and the bulb might not be as illustrated below.

• Make sure the ground is level and firm and place the motorcycle on its stand.
• Switch off the ignition.

• Remove cover panel 1 to replace the bulb for the low-beam headlight.

• Remove cover panel 2 to replace the bulb for the high-beam headlight.

• Disconnect plug 3.
Release spring clip 4 at left and right and swing it up.

Remove bulb 5 from the socket.

Replace the defective bulb.

Bulbs with higher light-intensity ratings are available through aftermarket suppliers. These bulbs burn out more rapidly and generate more heat than conventional bulbs. Under adverse conditions the extra heat can cause damage to the headlight.

Install bulb 5. Begin by seating lug 6 and then press the bulb into the socket.

Engage spring clip 4 in the catch on left and right.

Connect plug 3.

Install the cover.

**Replacing bulb for left parking light**

- Make sure the ground is level and firm and place the motorcycle on its stand.
- Switch off the ignition.
1. Remove cover 1.
2. Push down retainer 2 (using a screwdriver if necessary) and pull socket 3 out of the headlight housing.
3. Remove bulb 4 from the socket.
4. Replace the defective bulb.
   Bulb for parking light
   W5W / 12 V / 5 W
   Use a clean, dry cloth to hold the bulb in order to keep the glass free of dirt and foreign matter.
5. Insert bulb 4 into the socket.
6. Insert socket 3 into the headlight housing, making sure that retainer 2 engages.
7. Install the cover.
Replacing bulb for right side light

- Make sure the ground is level and firm and place the motorcycle on its stand.
- Switch off the ignition.

1. Remove cover 1.

2. Push down retainer 2 (using a screwdriver if necessary) and pull socket 3 out of the headlight housing.

3. Remove bulb 4 from the socket.

4. Insert bulb 4 into the socket.

- Replace the defective bulb.

Bulb for parking light

W5W / 12 V / 5 W

- Use a clean, dry cloth to hold the bulb in order to keep the glass free of dirt and foreign matter.
Insert socket 3 into the headlight housing, making sure that retainer 2 engages.
• Install the cover.

Replacing bulbs for front and rear turn indicators
• The LED turn indicators can be replaced only as a complete unit. Consult a specialist workshop, preferably an authorised BMW Motorrad dealer.

LED rear light
If the number of LEDs in the rear light that have failed exceeds the number stated in the Technical Data below, the rear light must be replaced. Under these circumstances:
• Seek the advice of a specialist workshop, preferably an authorised BMW Motorrad dealer.

<table>
<thead>
<tr>
<th>Maximum number of defective LEDs in rear-light unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
</tr>
</tbody>
</table>

Replacing number-plate light
• Pull number-plate light bulb 1 out of the light housing.

• Remove the bulb from the socket.
• Replace the faulty number-plate light.

Bulb for number-plate light
W5W / 12 V / 5 W

• Use a clean, dry cloth to hold the bulb in order to keep the glass free of dirt and foreign matter.

Push the bulb into the bulb socket.

Press number-plate light bulb 1 into the light housing.

Fuses
Removing fuse

Any attempt to jumper a defective fuse gives rise to the risk of a short-circuit and fire. Always replace a defective fuse with a new fuse of the same amperage.

Switch off the ignition.

Switch on the ignition, and make sure the ground is level and firm and place the motorcycle on its stand.

If fuse defects recur frequently have the electric circuits checked by a specialist.

Switch off the ignition.

Switch on the ignition, and make sure the ground is level and firm and place the motorcycle on its stand.

If fuse defects recur frequently have the electric circuits checked by a specialist.

Switch off the ignition.

Switch on the ignition, and make sure the ground is level and firm and place the motorcycle on its stand.

If fuse defects recur frequently have the electric circuits checked by a specialist.

Switch off the ignition.

Switch on the ignition, and make sure the ground is level and firm and place the motorcycle on its stand.

If fuse defects recur frequently have the electric circuits checked by a specialist.

Switch off the ignition.

Switch on the ignition, and make sure the ground is level and firm and place the motorcycle on its stand.

If fuse defects recur frequently have the electric circuits checked by a specialist.

Switch off the ignition.

Switch on the ignition, and make sure the ground is level and firm and place the motorcycle on its stand.

If fuse defects recur frequently have the electric circuits checked by a specialist.
workshop, preferably an authorised BMW Motorrad dealer. ►

**Installing fuse**

- Replace the defective fuse with a fuse of the correct amperage rating.
- The fuse assignments and fuse amperage ratings specified for your motorcycle are listed in the section entitled "Technical data". The figures in the graphic correspond to the fuse numbers. ►
- Close the fuse cover.

- The latch engages with an audible click.
- Installing rear seat cover (► 55).
- Installing rear seat (► 56).

**Jump-starting**

- The wires leading to the power socket do not have a load-capacity rating adequate for jump-starting the engine. Excessively high current can lead to a cable fire or damage to the vehicle electronics. Do not use the on-board socket to jump-start the engine of the motorcycle. ►
- Touching live parts of the ignition system with the engine running can cause electric shock. Do not touch parts of the ignition system when the engine is running. ►
- A short-circuit can result if the crocodile clips of the jump leads are accidentally brought into contact with the motorcycle. Use only jump leads fitted with fully insulated crocodile clips at both ends. ►
- Jump-starting with a donor-battery voltage higher than 12 V can damage the vehicle electronics. Make sure that the battery of the donor vehicle has a voltage rating of 12 V. ►
- When jump-starting the engine, do not disconnect the battery from the on-board electrical system.
- Remove the front seat (► 57).
- Run the engine of the donor vehicle during jump-starting.
- Begin by connecting one end of the red jump lead to the positive terminal of the dis-
charged battery and the other end to the positive terminal of the donor battery.
• Then connect one end of the black jump lead to the negative terminal of the donor battery, and the other end to the negative terminal of the discharged battery.
• Start the engine of the vehicle with the discharged battery in the usual way; if the engine does not start, wait a few minutes before repeating the attempt in order to protect the starter motor and the donor battery.
• Allow both engines to idle for a few minutes before disconnecting the jump leads.
• Disconnect the jump lead from the negative terminals first, then disconnect the second lead from the positive terminals.
• Installing front seat (⇒ 57).

Battery
Maintenance instructions
Correct upkeep, recharging and storage will prolong the life of the battery and are essential if warranty claims are to be considered. Compliance with the points below is important in order to maximise battery life:
– Keep the surface of the battery clean and dry.
– Do not open the battery.
– Do not top up with water.
– Be sure to read and comply with the instructions for charging the battery on the following pages.
– Do not turn the battery upside down.

If the battery is not disconnected, the on-board electronics (e.g. clock, etc.) gradually drain the battery. This can cause the battery to run flat. If this happens, warranty claims will not be accepted.
Connect a float charger to the battery if the motorcycle is to remain out of use for more than four weeks.

BMW Motorrad has developed a float charger specially designed for compatibility with the electronics of your motorcycle. Using this charger, you can keep the battery charged during long periods of disuse, without having to disconnect the battery from the motorcycle’s on-board systems. You can obtain additional information from your authorised BMW Motorrad dealer.

Disconnecting battery from motorcycle
• Make sure the ground is level and firm and place the motorcycle on its stand.
- Remove the front seat (⇒ 57).

Disconnection in the wrong sequence increases the risk of short-circuits. Always proceed in the correct sequence.

- First disconnect battery negative lead 1.
- Then disconnect battery positive lead 2.

Connecting battery to motorcycle

- Connect battery positive lead 2 first.
- Then install battery negative lead 1.
• Connect battery positive lead 2 first.
• Then install battery negative lead 1.
• Installing front seat (957).

**Recharge the battery**
- Disconnecting battery from motorcycle (9160).
- Charge the battery using a suitable charger.
- Comply with the operating instructions of the charger.
- Once the battery is fully charged, disconnect the charger's terminal clips from the battery terminals.

The battery has to be recharged at regular intervals in the course of a lengthy period of disuse. See the instructions for caring for your battery. Always fully recharge the battery before restoring it to use.

**Remove the battery**
- Disconnecting battery from motorcycle (9160).
- Lift the battery up and out; work it slightly back and forth if it is difficult to remove.

**Installing battery**
- If the battery was disconnected from the motorcycle for a prolonged period of time it will be necessary to enter the current date in the instrument panel, in order to ensure that the service-due indicator functions correctly.
- Place the battery in the battery compartment, positive terminal on the right in the forward direction of travel.
- Connecting battery to motorcycle (9161).
- Setting the clock (937).
Care

Care products .................. 164
Washing the vehicle ............... 164
Cleaning easily damaged compon- ents .................. 164
Paint care ...................... 165
Protective wax coating .......... 166
Laying up the motorcycle ......... 166
Restoring motorcycle to use ...... 166
Care products
BMW Motorrad recommends that you use the cleaning and care products you can obtain from your authorised BMW Motorrad dealer. The substances in BMW Care Products have been tested in laboratories and in practice; they provide optimised care and protection for the materials used in your vehicle.

⚠️ The use of unsuitable cleaning and care products can damage vehicle components. Do not use solvents such as cellulose thinners, cold cleaners, fuel or the like, and do not use cleaning products that contain alcohol.

Washing the vehicle
BMW Motorrad recommends that you use BMW insect remover to soften and wash off insects and stubborn dirt on painted parts prior to washing the vehicle.

To prevent stains, do not wash the vehicle immediately after it has been exposed to strong sunlight and do not wash it in the sun.

Make sure that the vehicle is washed frequently, especially during the winter months. To remove road salt, clean the motorcycle with cold water immediately after every trip.

⚠️ After the motorcycle has been washed, ridden through water or ridden in the rain, the brake discs and pads might be wet and the brakes might not take effect immediately.

Apply the brakes in good time until the brake discs and brake pads have dried out.

⚠️ Warm water intensifies the effect of salt. Use only cold water to wash off road salt.

⚠️ The high pressure of high-pressure cleaners (steam cleaners) can damage seals, the hydraulic brake system, the electrical system, and the seat. Exercise restraint when using a steam jet or high-pressure cleaning equipment.

Cleaning easily damaged components
Plastics

⚠️ The use of unsuitable products to clean plastic parts can damage the surface. Do not use cleaning agents that...
contain alcohol, solvents or abrasives to clean plastic parts. Even insect-remover pads or cleaning pads with hard surfaces can produce scratches.

**Body panels**
Clean the trim panels with water and BMW plastic care emulsion.

**Windscreens and lenses made of plastic**
Clean off dirt and insects with a soft sponge and plenty of water. Soften stubborn dirt and insects by covering the affected areas with a wet cloth.

Clean with water and sponge only.

Do not use any chemical cleaning agents.

**Chrome**
Use plenty of water and BMW shampoo to clean chrome, particularly if it has been exposed to road salt. Use chrome polish for additional treatment.

**Radiator**
Clean the radiator regularly to prevent overheating of the engine due to inadequate cooling. For example, use a garden hose with low water pressure.

Cooling fins can be bent easily. Take care not to bend the fins when cleaning the radiator.

**Rubber**
Treat rubber components with water or BMW rubber-care products.

Using silicone sprays for the care of rubber seals can cause damage.

Do not use silicone sprays or care products that contain silicon.

**Paint care**
Washing the vehicle regularly will help counteract the long-term effects of substances that can damage the paint, especially if your vehicle is ridden in areas with high air pollution or natural sources of foreign matter, for example tree resin or pollen.

Remove particularly aggressive substances immediately, however, as otherwise the paint can be affected or become discoloured. Substances of this nature include spilt fuel, oil, grease, brake fluid and bird droppings. We recommend BMW vehicle polish or BMW paint cleaner for this purpose.

Foreign matter on the paintwork is particularly easy to see after the vehicle has been washed.
Remove stains of this kind immediately, using cleaning-grade benzene or petroleum spirit on a clean cloth or ball of cotton wool. BMW Motorrad recommends using BMW tar remover for removing specks of tar. Remember to wax the parts treated in this way.

**Protective wax coating**
BMW Motorrad recommends applying only BMW car wax or products containing carnauba wax or synthetic wax.
It is time to rewax the paintwork when water "puddles" on the surface, instead of forming beads.

**Laying up the motorcycle**
- Fill the motorcycle's fuel tank.
- Clean the motorcycle.
- Remove the battery.

- Spray the brake and clutch lever pivots and the main and side stand pivots with a suitable lubricant.
- Coat bright metal and chrome-plated parts with an acid-free grease (e.g. Vaseline).
- Stand the motorcycle in a dry room in such a way that there is no load on either wheel.

Before laying the vehicle up out of use, have the engine oil and the oil filter element changed by a specialist workshop, preferably an authorised BMW Motorrad dealer. Combine work for laying up/restoring to use with a BMW service or inspection.

**Restoring motorcycle to use**
- Remove the protective wax coating.
- Clean the motorcycle.

- Install a charged battery.
- Before starting: work through the checklist.

Confirmation of service .......... 189
BMW Motorrad Service

BMW Motorrad has an extensive network of dealerships in place to look after you and your motorcycle in more than 100 countries. Authorised BMW Motorrad dealerships have the technical information and the technical know-how to carry out reliably all maintenance and repair work on your BMW.

You can locate your nearest authorised BMW Motorrad dealership by visiting our website: www.bmw-motorrad.com

If maintenance and repair work is performed inexpertly, it could result in consequential damage and thus constitute a safety risk.

BMW Motorrad recommends you to have all the associated work on your motorcycle carried out by a specialist workshop, preferably an authorised BMW Motorrad dealer.

In order to help ensure that your BMW is always in optimum condition, BMW Motorrad recommends compliance with the maintenance intervals specified for your motorcycle. Have all maintenance and repair work that is carried out confirmed in the "Service" chapter in this manual. For generous treatment of claims submitted after the warranty period has expired, evidence of regular maintenance is essential.

Your authorised BMW Motorrad dealer can provide information on BMW services and the work undertaken as part of each service.

BMW Motorrad Mobility services

As owner of a new BMW motorcycle, in circumstances in which assistance is required you can benefit from the protection afforded by the various BMW Motorrad mobility services (e.g. Mobile Service, breakdown service, vehicle recovery service). Your authorised BMW Motorrad dealer will be happy to provide information about the mobility services available to you.

Maintenance work

BMW Pre-delivery Check

Your authorised BMW Motorrad dealer conducts the BMW pre-delivery check before handing over the vehicle to you.
BMW Running-in Check
The BMW running-in check has to be performed when the vehicle has covered between 500 km and 1200 km.

BMW Service
The BMW Service is carried out once a year; the extent of servicing can vary, depending on the age of the vehicle and the distance it has covered. Your authorised BMW Motorrad dealer confirms that the service work has been carried out and enters the date when the next service will be due.

Riders who cover long distances in a year might have to bring in their vehicles for service before the next scheduled date. It is to allow for these cases that a maximum odometer reading is reached before the next scheduled date for the service.

To find out more about service go to: bmw-motorrad.com/service

The service-due indicator in the multifunction display reminds you about one month or 1000 km (700 miles) in advance when the time for a service is approaching, on the basis of the programmed values.

The regular service intervals as stated apply to motorcycles used on public roads. In the case of motorcycles used for racing, the intervals have to be adapted accordingly in line with the increased wear and tear associated with this mode of use.
