

MONOKEI

The Hiro SE marks the first all brass, all PVD finish keyboard kit offered by MONOKEI.

Our *Bounty Hunter* PVD finish is an arduous process involving parts meticulously milled, bead blasted and topped off with a unique reflective coating. This process can sometimes include the following defects:

### **Screw holes under feet**

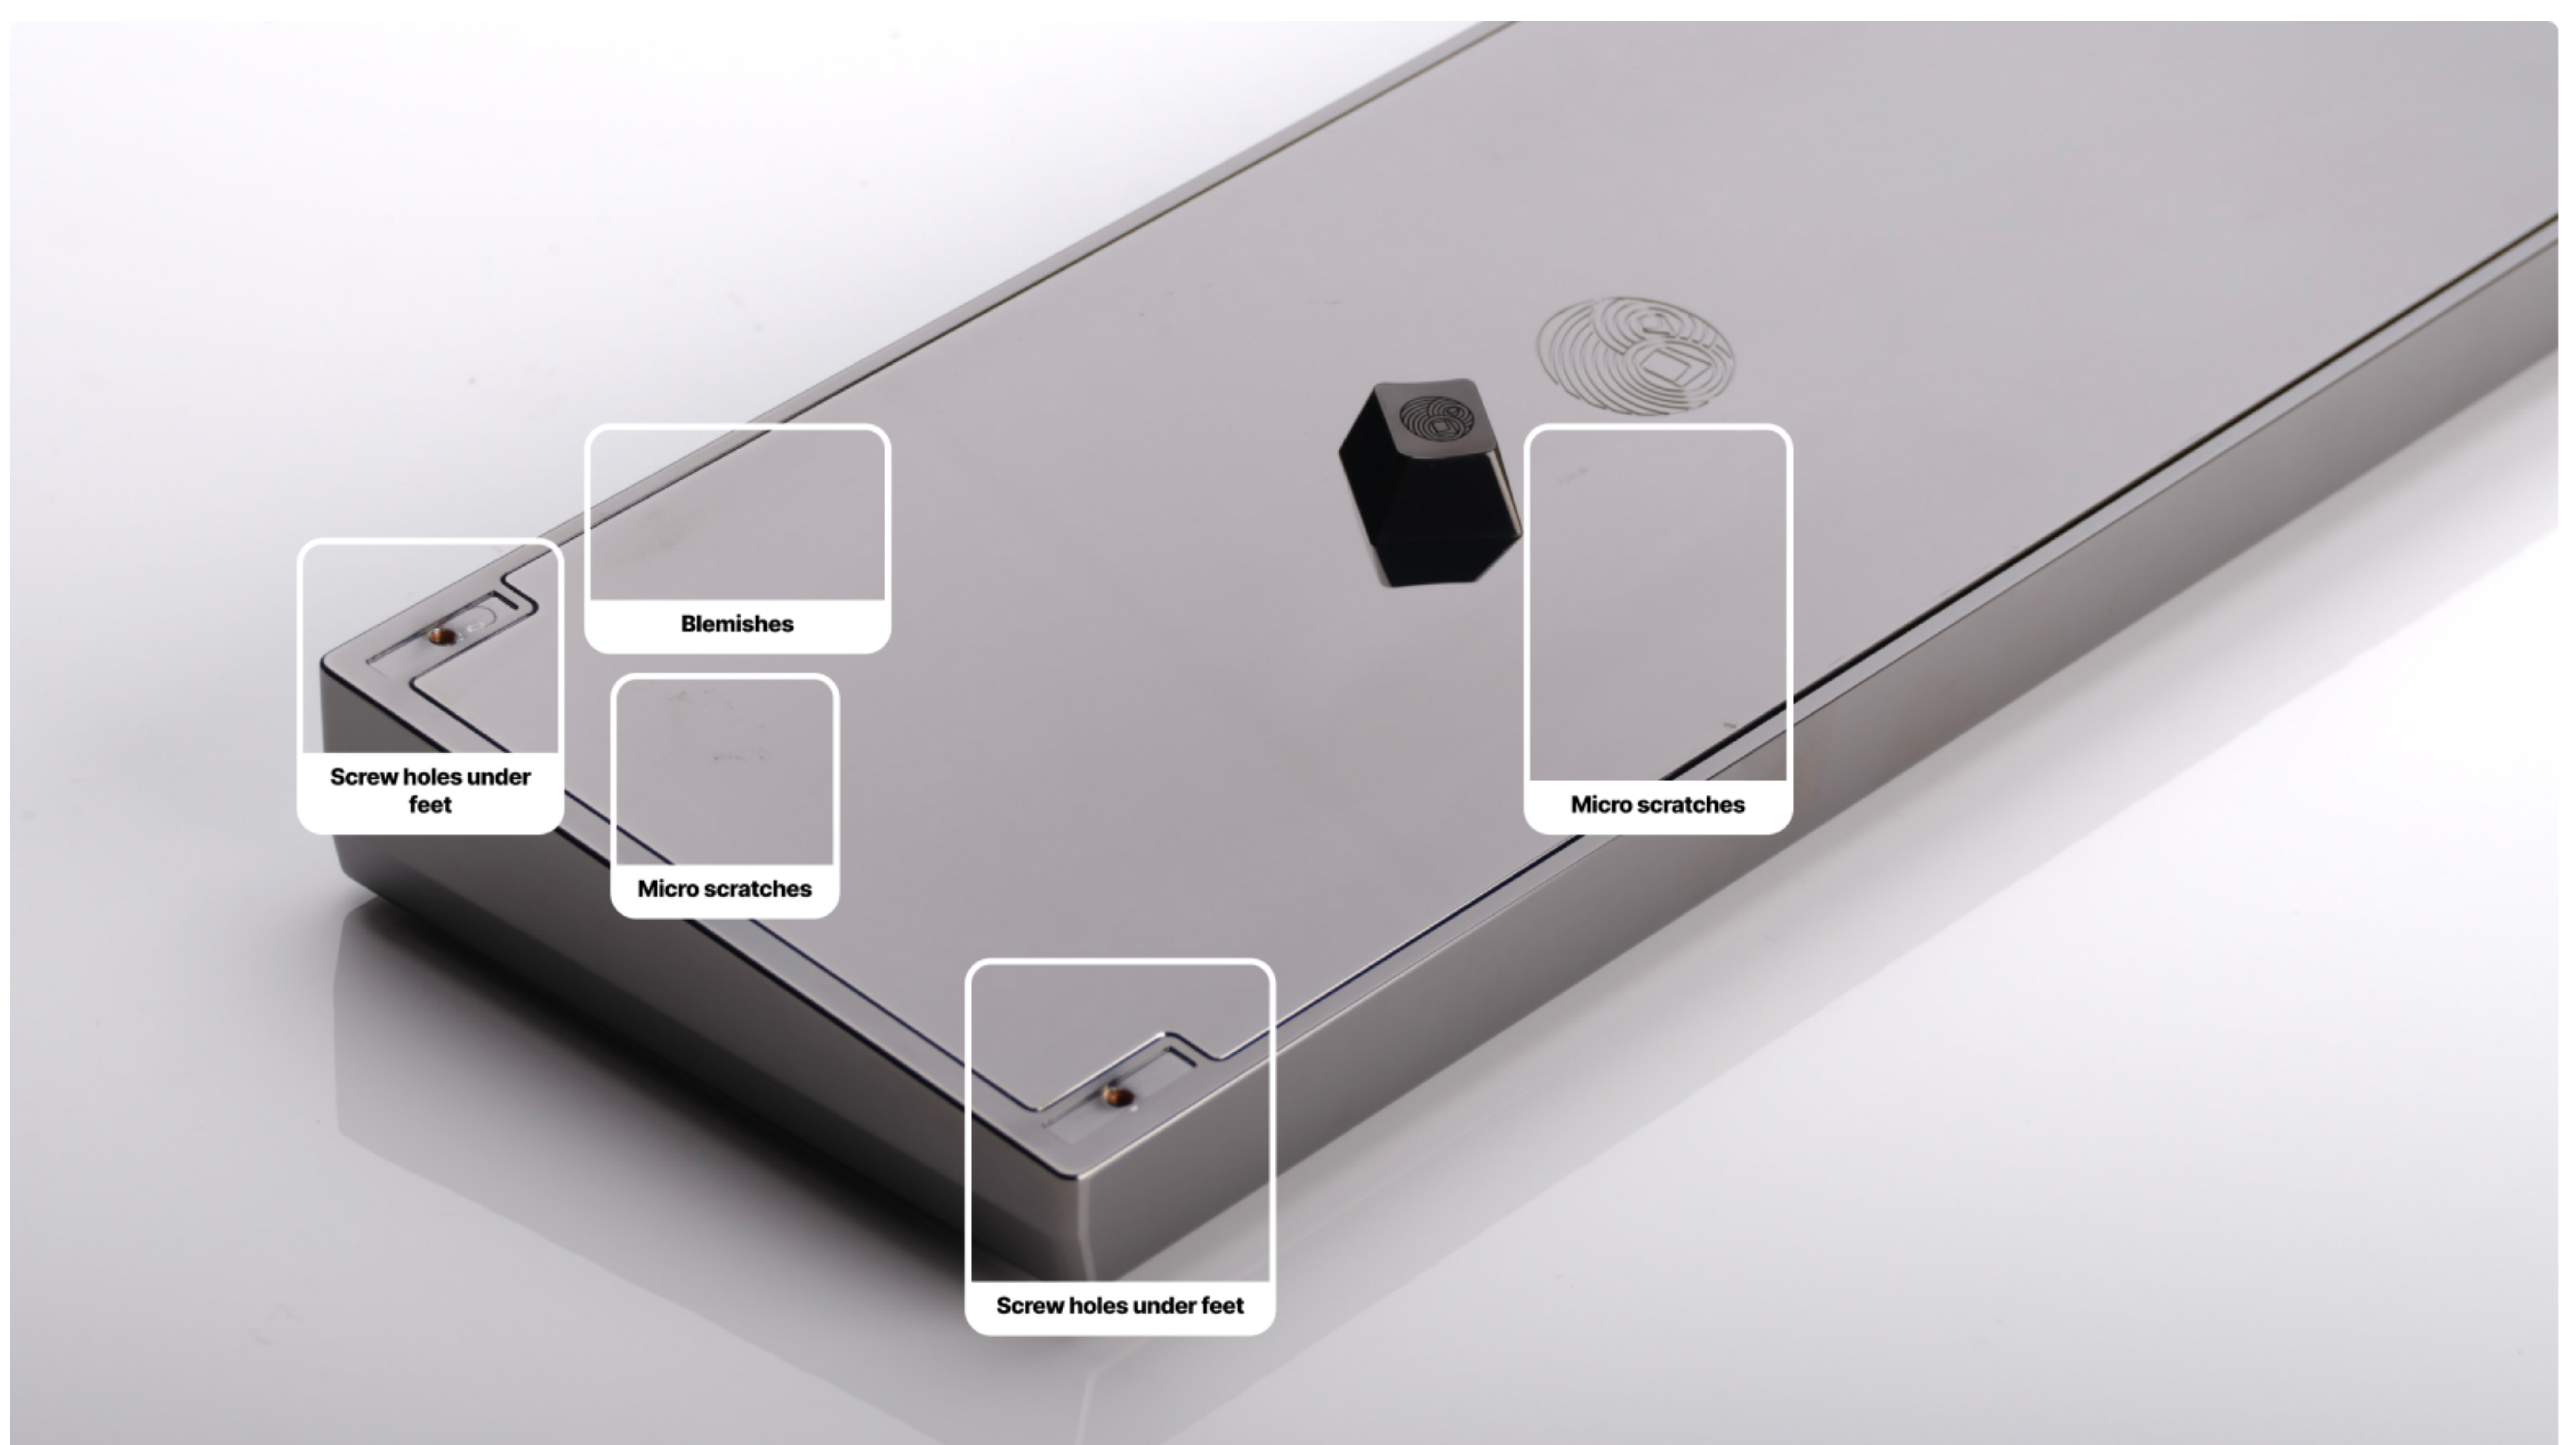

We've included screw holes under the feet location to ensure that the parts can be hooked onto their respective jigs during the PVD and subsequent polishing processes. These screw holes will not require additional finishing.

## Internal machining lines

The internal parts of the Hiro SE kit may exhibit CNC machine lines. These tend to be geometric and indicative of the CNC machining pathway used during the milling process.

## Micro scratches / Blemishes

There may be micro scratches visible at certain angles on external surfaces of the kit. This includes minor blemishes that remain after the polishing process.
