

# How to Use Ozone for Car Odors

1. To treat your car with ozone you will need an ozone generator capable of air sanitization and an extension cord
2. Before beginning, place your car near a power outlet or have an extension cord that will reach the vehicle
3. First, crack the passenger window far enough for the power cord to fit in
4. Then, place your unit on the passenger front floorboard
5. Next, turn your car A/C on with the recirculation turned on
6. Turn on your unit for 15 minutes and allow the car to circulate the ozone through the cooling system to help oxidize smells and allergens in the cooling vents
7. After the ozonation process is complete, wait 30 minutes for the ozone to dissipate
8. Your car should be smelling fresh now, but if you can still smell the odors you were trying to eliminate, repeat the process

***Please Note: Be sure to only use your ozone generator in an unoccupied area. Our units produce high amounts of ozone. It is not safe to run the unit in an occupied area for more than 1 minutes. Be sure to remove any valuable items, pets and/or plants before you use the ozone generator. Do not breathe in ozone directly.***
