PLEASE READ THIS FIRST:

We know, reading manuals isn’t always fun. But we promise it’s worth it.

We’ve helped hundreds of customers improve signal to their cellular LTE/5G routers. We’ve compiled everything we’ve learned in this manual.

Give it a read before you start: it’ll save you time and help you get the best performance out of your MIMO External Antenna.

About Waveform

Your MIMO External Antenna is sold and supported by Waveform and our team of Signal Specialists.

We’ve helped over 20,000 customers boost their signal since our company was founded in 2007. We’ve installed and configured thousands of devices in buildings across the country, and we’re here to help. If you have any issues at all, please don’t hesitate to reach out.
What’s in the Box

Antennas

Depending on which antenna you purchased, you’ll either have a single MIMO Panel Antenna or two Log Periodic Antennas. We recommend using the Log Periodic Antennas if you have line-of-sight to your nearest cell towers. Our MIMO Panel Antenna may perform slightly better if you’re surrounded by trees, buildings, or hills.

Cables and Adapters (optional, only included with complete kit)

If you purchased a complete antenna kit, the parts listed below will also come included.
Install Manuals, Who Needs ‘Em?

Heads up: using MIMO antennas to improve your signal can take a bit of patience.

We’d be surprised if you saw better data rates immediately upon connecting the antennas. Be prepared to spend an hour or two to find the right location and direction for your antennas.

This manual is based on feedback from hundreds of customers like you. We’ve revised it dozens of times based to make it as helpful as possible and make the process of getting better data rates as easy as we can.

We promise you’ll be glad if you read it from start to finish before you get started. It’ll help you save time, avoid the most common pitfalls, and ensure your system works as well as possible.

Who We Are

Hi! We’re Waveform. We’ve been around since 2007, and while we’ve grown a bunch since then we’re still a small team. There’s just a handful of us answering texts, and picking up calls.

The four of us pictured below lead support and product development. Feel free to reach out to us at any time; our emails are all just our first names @waveform.com

Stuck? Have Questions? Please: Contact Us!

We’re a small team, but we really care about helping you get the best results.

Talking to customers is what helps us improve our products. We can also help troubleshoot, and sometimes a small tweak we suggest can make all the difference.

Even if everything goes smoothly, reach out and let us know how your system is performing. We love getting feedback: let us know if there’s any way we could have made the install process or this manual better.

Call us at (800) 761-3041 or email help@waveform.com. We’re available from 9am-5pm PT, Monday to Friday.
Before You Start

It’s important that there’s at least some 4G LTE or 5G signal outside or on the roof of the building where you’re installing the MIMO antennas, and ideally it should be “usable.” If you don’t have usable signal outside, proceed with caution, and consider giving us a call.

What Do We Mean by “Usable”?

When you take your cellular router or hotspot outdoors, you should have a reliable data connection even without connecting your new external MIMO antenna(s). When running a speed test, you should have at least 0.1 Mbps download and upload speed.

MIMO antennas will help condition the outdoor signal and get you better data rates. But if the signal outside your building isn’t usable to begin with, MIMO antennas might not help.

You can certainly still give the MIMO antenna a shot, but you may still be unable to connect.

Compatibility

First, a quick reminder: our MIMO Panel and Log Periodic Antennas support almost every 3G, 4G LTE, and low/mid-band 5G service in use in the US and across the world. Here are the bands they cover:

Supports all 4G LTE bands between 600 and 2700 MHz, including:

- **AT&T**: B2, B4, B5, B12, B17, B29, B30, B66
- **Verizon**: B2, B4, B5, B13, B66
- **T-Mobile**: B2, B4, B5, B12, B25, B26, B41, B66, B71

Supports all 5G bands between 600 and 2700 MHz, including:

- **AT&T**: n2, n5, n66
- **Verizon**: n2, n5, n66
- **T-Mobile**: n41, n71
How Much Improvement Should You Expect?

In short: it’s hard to say. Many people see an increase in data rates of between 50% and 200%. But some people only see 10%. Our CEO often says that despite all the science, wireless signals often work in “strange and magical” ways.

One thing is for sure: the more patient you are and the more locations and directions you try, the more likely you are to see a big increase in data rates.

If you’ve gone through this manual and aimed the antenna(s) as we suggest, but you’re still not seeing much improvement, reach out to us for help. We’re generally available from 9 am to 5 pm PT, Monday to Friday, and we love helping solve tricky install problems.

01 Install Process Overview

This is the process that we suggest using for installing your MIMO External Antenna:

1 Read this manual. Ideally from start to finish so that you understand the whole process before you begin.

2 Assemble your antenna(s) to your mount. Start by assembling your mount and attaching your MIMO Panel Antenna or cross-polarized Log Periodic Antennas.

3 Find the best antenna location and direction. This step is the most time-consuming, but it’s worth the effort. Getting it right has a huge impact on your system’s performance. Make notes of your readings on the table in section 4.

4 Verify performance and hard-wire everything. Without making any holes in your roof or walls, temporarily run the cable indoors to your hotspot or router and run speed tests. If everything looks good, it’s time to finalize cable runs and hard-wire everything.

5 Tell us how your system is doing. We really love hearing how our customers’ systems are performing. Send an email or give us a call and let us know how things look.
Assembling the Antenna(s)

The pictures below show how your antenna(s) should be secured to your mount. We’ve shown this with the optional J-Mount, included only in the complete kit, but any mount will do.

If you have two Log Periodic Antennas: Note how the two Log Periodic Antennas on the right are angled at 45 degrees in opposite directions. This is called “cross-polarization” and is crucial to MIMO. Mount these exactly as in the image and then treat them as a single antenna.

For the next step in section 3 it’ll be helpful to have your antennas attached to your mount, so take some time now to get these set up before moving on.

If you’d like more detailed instructions on how to assemble our J-Mount and mount the L-bracket(s), you can find that online at waveform.com/polemount-instructions
Finding the right antenna position for your MIMO antenna(s) is the most important part of the install. In this section, we explain the best and simplest method for positioning and aiming. Section 7 covers some more advanced tips that we don’t recommend for most users.

The Goal

Your aim is to find the best location and direction for the antenna(s). The location should maximize data rates to your LTE/5G router or hotspot. It can take a little patience, but spending some time here can have a huge impact - it’s worth a bit of extra effort.

Set up Your MIMO Antenna in “Test Mode”

Is your hotspot or router battery-powered? Or do you have a power extension cord?

If so, set up your MIMO antenna(s) in “test mode” by connecting them directly to your router. Take your hotspot and antenna outside with you, and you’ll have everything you need to start testing different locations and directions.

Here’s how to set up your hotspot and antenna(s) in test mode, if you’re using the adapters included in the complete kit:

Don’t have a way of taking your router outdoors with you? No problem. Just keep your router or hotspot indoors near a power socket, and use a longer coax cable in place of the barrel adapters so you can take just the antenna(s) outside.
If you aren’t able to bring your router or hotspot outside with you, then your connection speed may be limited by the router’s WiFi range rather than its cellular connection. So we recommend asking a second person to stay near the hotspot or router with a phone: ask them to run speed tests as you try different positions with the antenna(s).

Running Speed Tests

Since the goal is improved data rates, it makes sense to use a speed test app to measure your data rates through your cellular router or hotspot’s WiFi.

If you’re testing with your phone, download our favorite speed test app (“Speedtest by Ookla”) by visiting this URL: waveform.com/speedtest. If you’re using a laptop, visit speedtest.net in a browser. Go ahead and run a couple of speed tests indoors from a device connected to your router or hotspot’s WiFi. You’ll notice your results fluctuate a little between tests – that’s normal.

Now go outside. With each location and direction you try, run 1-2 speed tests, and make a note of the results in the table on the opposite page.

How to Position & Aim

Finding the right antenna location and direction takes some patience, but it’s absolutely worth it. Spending time to get it right will have a big impact on your system’s performance. Here are all the locations and directions where we recommend testing your MIMO antenna(s):

![Diagram of antenna positions]

Don’t just go to the highest point of the roof! While signal is generally stronger the higher you go, there’s also often more interference. We’ve found it’s often better to mount the antenna(s) on the side of the building where the structure can shield the antennas from interference.

Once you’ve found the best antenna location and direction, move on to section 5 below to get ready for your final installation.
Use the table below to make notes of your data rate measurements while you’re positioning and aiming the antenna(s).

</table>
Once you’ve identified the best location for your antenna(s), it’s time to set up a provisional install. Keep your antenna(s) outside in the location you’ve selected, but run the cables and test your router/hotspot indoors.

Don’t drill any holes in your walls yet! Start with a temporary install to make sure everything is working well, as described in the next section of the manual.

If you purchased the complete kit with your MIMO antenna(s), follow the steps below to assemble and install your MIMO Antenna kit. If you just purchased the antenna, your assembly may look a little different.

**Getting the Complete Kit Set Up**

Refer to the diagram to the right as needed, for assembling the complete kit.

1. Secure your MIMO Panel Antenna or Log Periodic Antennas to your mount if you haven’t already. If your kit includes the 2x Log Periodic Antennas, be sure to cross-polarize them at ±45° from vertical (90° to each other). See section 2 above for more information.

2. Mount the antenna(s) outdoors in the location and direction where you found the fastest data rates using the method described in section 3.

3. Connect your MIMO Panel Antenna or Log Periodic Antennas directly to the coax cables (RS400 if you purchased the complete kit).

4. Connect the two coax cables to the adapters and hand-tighten them.

5. Connect the two adapters to your cellular router or hotspot.
MIMO Panel Antenna or cross polarized Log Periodic Antennas
Depending on which kit you purchased. Shown with the optional J-Mount.

Your LTE/5G router
Connect the pigtails to the cellular antenna ports, not the WiFi antenna ports (if your unit has them).
Check your manual or search online if you’re not sure which is which.

SMA, TS9 or U.FL to N-Female Pigtail Adapter x2
Included with the optional kit only. Which one you use depends on the connectors on your hotspot or router.

30 ft RS400 Cable x2
Included with the optional kit only.
Test & Install Permanently

Before drilling holes in your walls, we recommend running cables temporarily through a window or door and testing to make sure that everything still works well.

If you’re happy with your data rates, you can start drilling holes and moving to a permanent install.

If you’re having issues with your temporary setup, or aren’t happy with the performance, don’t panic! We can help you figure it out. Call us at (800) 761-3041 or email help@waveform.com. We’re available from 9am-5pm PT, Monday to Friday.

A Quick Note on Surge Protection & Grounding

We recommend using two Lightning Surge Protector Kits to ground your outdoor antenna. These protect your router or hotspot in case of lightning and prevent high-voltage power from entering your home. The surge protectors should be installed just before the coaxial cable enters the building.

You can pick up a pair of Lightning Surge Protector Kits at waveform.com/surge-protector.

Both the surge protectors and your mount itself should be grounded. We recommend using at least 10 AWG cable. Keep in mind the numbers increase as the cable gets thinner. So 6 AWG and 8 AWG are both okay, but 12 AWG and 14 AWG are too thin.

If you have a satellite or HDTV antenna on your roof already, it’s likely grounded. You can simply ground the mast and lightning surge protectors to the satellite dish. Alternatively, you can ground your mast and antenna(s) directly to a grounding rod. Most homes should have a grounding rod, but if yours doesn’t you can purchase one easily at a hardware store.

Even if you don’t purchase a lightning surge protector, you should still make sure to at least ground your J-Mount.

Weatherproofing Outdoor Connections

N-type connectors are outdoor-rated, but water can still sometimes get in and cause issues. We strongly recommend wrapping all outdoor N-type connections with stretch-and-seal self-fusing silicone rubber tape (available from most hardware stores).
By this point, you should have a really solid understanding of how to aim your MIMO antenna(s) and get great performance. In fact, we’re convinced that for 95% of people, the instructions provided in this manual so far are more than enough.

If, however, you’d like to go a little deeper and get technical to optimize your system even further, here are some general guidelines.

1. Look up your nearby towers on CellMapper.net. Try to find the eNodeBIDs that your LTE/5G router or hotspot is connecting to using the device’s admin interface.

2. Aim your antenna(s) at each nearby tower and band lock your hotspot or router to every band that the tower transmits. Run speed tests on each band to find the fastest bands.

3. Try enabling multiple bands and using carrier aggregation to find the fastest band combination. Carrier aggregation allows your devices to connect to two or more bands simultaneously but doesn’t always result in an improvement. Stick to a single band if that gets you the best results.

Unfortunately, some devices don’t offer band locking, and many don’t list eNodeBIDs or any kind of cell tower identifiers, making these steps impossible. Every cellular router and hotspot is so different that we could never cover all of them with just one set of instructions.

However, we’ve written up guides for some of the most common devices, you can find them online at waveform.com/hotspot-guides.

We suggest reading our guide for your router, or referring to your user manual.

We’re Here to Help!

We know, there’s a lot of information out there and this can get very technical. Don’t be afraid!

If you’re having difficulty, aren’t happy with the performance of your system, or you’d just like a hand, we’d love to help! Call us at (800) 761-3041 or email help@waveform.com. We’re generally available from 9am-5pm PT, Monday to Friday.
Here are our final tips for a smooth installation and for good performance:

- **If you have extra cable, don’t coil it tightly.**
  If you have extra cable, make sure to keep any cable loops as large as possible to minimize negative side-effects (4 ft or wider loops are best).

- **If data rates decrease over time, consider re-optimizing your system.**
  Occasionally carriers will change their towers to broadcast different bands, light up new towers, or simply turn off existing towers altogether. If your data rates suddenly get worse, try re-aiming your antenna(s) to get the best results.

Did your installation go great? Are you having trouble aiming your antenna(s)? Do you think our manual could be improved? Are your data rates not quite what you were hoping?

**We’d love to hear from you:** give us a call at (800) 761-3041 or email help@waveform.com.

We’re not a huge, nameless corporation with lots of bureaucracy. **There is a small team of us** who wrote this manual and provide support for our products, and we love hearing how our products perform and understanding how we can get the absolute best cell signal in any given situation.

**So please, reach out!**
**Excited about your MIMO antenna?**

**Get 5% for each friend, family, or neighbor you refer.**

Hopefully by the time you’ve finished installing and tuning your MIMO antenna, you’re as excited about this product as we are.

One of our biggest challenges is spreading the word. Most people don’t know that products like our MIMO antenna exist.

Help us get the word out: everyone you refer gets 5% off their kit, and we’ll also give you 5% of whatever they spend in cash (via Paypal).

Simply visit [waveform.com/referrals](http://waveform.com/referrals) to get started.
Need help? We’re ready and waiting.

MIMO Antennas aren’t always easy to install. In fact, getting everything up and running can sometimes be a pain. But the end result is worth it.

One of the benefits of buying from Waveform is our lifetime technical support on every system we sell. We’ve installed hundreds of these devices ourselves, and can walk you through troubleshooting and fine-tuning your installation for best results.

Simply give us a call at (800) 761-3041, or pop us an email at help@waveform.com. We’re generally available from 9 am to 5 pm PT, Monday to Friday.

We love helping solve tricky install problems.
