

DISINFECT STRIPPING

When is it useful? The diapers have been in contact with a contagious disease, you have bought used diapers or you have problems with odors.

You will need to use disinfectant bleach (at least 5.25% sodium hypochlorite or with mention "kill viruses / - germ" or instruction for disinfection).

DIRECTIONS FOR USE (must be done on clean diapers)

- 1** Fill your washer or tub with cold water and add $\frac{1}{2}$ cup of bleach for an average load.
 - a. Note that bleach is only used in cold water.
- 2** Stir well.
- 3** Soak for 30 minutes, stirring occasionally.
- 4** Empty the tank and rinse with hot water (the hot water disables the bleach, this step is very important).
- 5** Rinse without soap and bleach at least twice or until you no longer see foam.
- 6** Wash in warm water with your usual detergent.
