

MARNING: Do not look directly at the sun.

CAUTION:

Never attempt to observe the sun with this telescope! Especially keep in mind while the telescope is used by children! Observing the sun – even for a very short time as this may cause blindness!

Packing material (plastic bags, etc.) must be kept out of reach of children!

RISK to your child!

Never look through this device directly at or near the sun. There is a risk of **BLINDING YOURSELF!**

RISK of material damage!

Children should only use this device under adult supervision. Keep packaging materials (plastic bags, etc.) away from children. There is a risk of SUFFOCATION!

Fire/Burning RISK!

Never subject the device - especially the lenses - to direct sunlight. Light ray concentration can cause

fires and/or burns.

Never take the device apart. Please consult Customer Service if there are any defects.

Do not subject the device to temperatures exceeding 140°F (60 °C).

TIPS on cleaning

Clean the lens (objective lens and eyepiece) only with a soft lint-free cloth (e.g. micro-fibre). Do not use excessive pressure - this may scratch the lens.

Dampen the cleaning cloth with lens cleaning solution (not supplied) and use it on very dirty lenses.

Protect the device against dirt and dust. Leave it to dry properly after use at room temperature. Then put the dust caps on and store the device in the case provided.

RESPECT Privacy!

This device is meant for private use. Respect others' privacy – do not use the device to look into other people's homes, for example.

DISPOSAL

Dispose of the packaging materials as legally required. Consult your local council on the matter if necessary.

Warning:

Never use a telescope to look at the sun! Looking at or near the sun will cause instant and irreversible damage to your eye. Eye damage is often painless, so there is no warning to the observer that damage has occurred until it is too late. Do not point the telescope or its viewfinder at or near the sun. Do not look through the telescope or its viewfinder as it is moving. Children should always have adult supervision while observing.

Telescope parts:

- 1 Focus wheel
- 2 Diagonal mirror
- 3 Eyepieces (12.5mm, 20mm)
- 4 Telescope (telescope tube)
- 5 Dew shield
- 6 Objective lens
- 7 Locating screw for the vertical adjustment (upward and downward motion)
- 8 Locating screw for the vertical axis (for turning to the right and left)
- 9 Tripod legs

Your telescope

Please look for a suitable location for your telescope before you begin. Use a stable surface e.g. a table. Mount the telescope to the tripod with the locating screw for the vertical adjustment (7). Insert the eye piece into the diagonal mirror (12.5mm or 20mm).

Azimuthal mounting

Azimuthal mounting just means that you can move your telescope up and down, left and right, without having to adjust the tripod. Use the locating screw for the vertical fine adjustment (7) and the locating screw for the vertical axis (8) to locate and lock the position of an object. (to focus an object)

Which evepiece is right?

First of all, it is important that you always choose an eyepiece with the highest focal width for the beginning of your observation. Afterwards, you can gradually move to eyepieces with smaller focal widths. The focal length is indicated in millimetres (mm) and is written on each eyepiece. In general, the following is true: The larger the focal width of an eyepiece, the smaller the magnification! There is a simple formula for calculating the magnification:

Focal length of the telescope tube: Focal length of the eyepiece = magnification

The magnification also depends on the focal length of the telescope tube. This telescope contains a telescope tube with focal length of 360mm. From this formula, shows that if you use an eyepiece with a focal width of 20mm, you will get the following magnification:

360mm / 20mm = 18x magnification

To make things simpler, here is a chart showing the magnifications.

Telescope tube focal width	Focal width of eyepiece	Magnification
360mm	20mm	18x
360mm	12.5mm	28.8x

Technical data:

Design: AchromaticFocal length: 360mmObjective diameter: 50mm

Possible objects for observation:

We have compiled and explained a number of very interesting celestial bodies and star clusters for you but we suggest that you start practicing during the day focusing on terrestrial objects such as birds and or trees at varying distances from you. On the accompanying images at the end of the instruction manual, you can see how objects will appear in good viewing conditions through your telescope at varying powers (see pictoral examples below).

Terrestrial views

Please note the example picture of Mount Rushmore. Start with the 20mm eyepiece and focus until clear. After mastering the focus with the 20mm change the 12.5mm eyepiece and practice focusing and scanning until images become clear in the eyepiece. We have included some additional examples that are possible with your telescope such as a bird and a green on a golf course. DO NOT POINT YOUR TELESCOPE DIRECTLY AT THE SUN OR BLINDNESS IS POSSIBLE.

The Moon

The moon is the Earth's only natural satellite. 3.476 km (2.2 miles) Diameter: 384.401 km (216.486 miles) Distance: approx.

Declination: +33° 01' (degrees: minutes) Distance:

2.3 light years

M 57 in the Lyra constellation

Right ascension:

Ring Nebula in Lyra constellation (M 57)

18:51.7 (hours: minutes)

famous Rina

The moon has been known to humans since prehistoric times. It is the second brightest object in the sky (after the sun). Because the moon circles the Earth once per month, the angle between the Earth. the moon and the sun is constantly changing; one sees this change in the phases of the moon. The time between two consecutive new moon phases is about 29.5 days (709 hours).

Orion Nebula (M 42)

M 42 in the Orion constellation

Right ascension: 05:32.9 (hours: minutes) Declination: -0.5° 25' (degrees: minutes)

Distance: 1.500 light years

With a distance of about 1.500 light years, the Orion Nebula (Messier 42, abbreviation: M 42) is the brightest diffuse nebula in the sky - visible with the naked eve and a rewarding object for telescopes in all sizes, from the smallest field glass to the largest earthbound observatories and the Hubble Space Telescope.

When talking about Orion, we're actually referring to the main part of a much larger cloud of hydrogen gas and dust, which spreads out with over 10 degrees over the half of the Orion constellation. The expanse of this enormous cloud stretches several hundred light years.

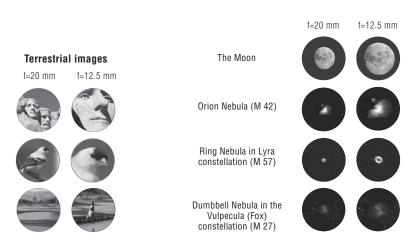

Nebula (Messier abbreviation: M 57) in the constellation of Lyra is often viewed as the prototype of a planetary nebula; it is one of the magnificent features of the Northern Hemisphere's summer sky. Recent studies have shown that it is probably comprised of a ring (torus) of brightly shining material that surrounds the central star (only visible with larger telescopes) and not of a gas structure in the form of a sphere or an ellipsis. If you were to look at the Ring Nebula from the side, it would look like the Dumbbell Nebula (M 27), With this object, we're looking directly at the pole of the nebula.

Dumbbell Nebula in the Vulpecula (Fox) constellation (M 27)

M 27 in the Fox constellation

Right ascension: 19:59.6 (hours: minutes) Declination: +22° 43' (angle: minutes) Distance: 1.360 light years

The Dumbbell Nebula (Messier 27, abbreviation: M 27) in Fox was the first planetary nebula ever discovered. On July 12, 1764, Charles Messier discovered this new and fascinating class of objects. We see this object almost directly from its equatorial plane. If you could see the Dumbbell Nebula from one of the poles, it would probably reveal the shape of a ring and we would see something very similar to what we know from the Ring Nebula (M 57). In reasonably good weather, we can see this object well even with small magnifications.

Telescope ABC's

What do the following terms mean?

Diagonal:

A mirror that deflects the ray of light 90 degrees. With a horizontal telescope tube, this device deflects the light upwards so that you can comfortably observe by looking downwards into the eyepiece. The image in a diagonal mirror appears upright, but rotated around its vertical axis (mirror image).

Focal length:

Everything that magnifies an object via an optic (lens) has a certain focal length (FL). The FL is the length of the path the light travels from the surface of the lens to its focal point. The focal point is also referred to as the focus. In focus, the image is clear. In the case of a telescope, the FL of the telescope tube and the eyepieces are combined.

Lens:

The lens turns the light which falls on it around in such a way that the light gives a clear image in the focal point after it has travelled a certain distance (focal length).

Eyepiece:

An eyepiece is a system made for your eye and comprised of one or more lenses. In an eyepiece, the clear image that is generated in the focal point of a lens is captured and magnified still more.

There is a simple formula for calculating the magnification:

Focal length of the telescope tube, divided by, Focal length of the eyepiece = Magnification

You see: In a telescope, the magnification depends on both the focal length of the telescope tube and the focal length of the eyepiece.

Magnification:

The magnification corresponds to the difference between observation with the naked eye and observation through a magnification apparatus (e.g. a telescope). In this scheme, observation with the eye is considered "single", or 1x magnification. Accordingly, if a telescope has a magnification of 30x, then an object viewed through the telescope will appear 30 times larger than it would with the naked eye. See also "Eveniece."

Troubleshooting:

Problem: Advice:

No picture Remove dust protection

cap and sun-shield from the objective opening.

Blurred picture Adjust focus using focus

ring

No focus possible Wait for temperature to

balance out

Bad picture Never observe through a

glass surface

Viewing object visible in the finder, but not through the telescope

Adjust finder

DISPOSAL

Dispose of the packaging materials properly, according to their type (paper, cardboard, etc).

Contact your local waste disposal service or environmental authority for information on the proper disposal.

Please take the current legal regulations into account when disposing of your device. You can get more information on the proper disposal from your local waste disposal service or environmental authority.

Warning- The lens contains lead that may be harmful. Wash hands after touching.
