

WELCOME TO OUR SLICK-ADELIC COLLECTION!

Eight stunning magnetic, multichrome lacquers. While there are several techniques to magnetizing polish, below you'll find the method that works best for us. There can be a learning curve, but we promise the end result will be worth it. Relax, and enjoy the process.

- 1) Shake bottle well to ensure the magnetic pigment is evenly distributed.
- 2) Apply polish to all nails to reach near full opacity. We recommend 1-2 coats depending on nail length/application. Allow for a little dry time between coats.
- 3) **Complete this next step one nail at a time.** Apply an additional coat of polish, then immediately hold the magnet a couple millimeters over the nail for a minimum of 45 seconds (60 seconds is ideal). Alternatively, if the magnet surface is wide enough, rest your fingertip on it and paint nail as per usual, holding finger still for 45+ seconds.

As the polish dries, it will lock in the magnetic effect. The shorter the time magnetized, the less crisp the effect will be once the polish is fully cured. The magnetic pigment disperses away from the pattern when the magnet is removed without enough dry time. This is why it's important to hold it for a substantial amount of time.

- 4) After all nails are done, **continue working one nail at a time** to apply topcoat. Magnetize the nail for another 45+ seconds while the topcoat dries, as it will "re-liquify" the magnetic component, allowing the pigment to disperse a little more. We suggest using a quick dry topcoat as this sets the pigment faster.

TIP - Make sure you are holding the same magnetic pattern over the same orientation as before.

- 5) Once everything is done and dried - check out your gorgeous manicure!
