

We, as the undersigned FONDIS manufacturer, attest that:

- our product range ULYS and their derivatives
- our product range STELLA3 and their derivatives
- our product range V60L-V80L & V100L and their derivatives

can be installed in a house where a mechanical heat recovery system is installed and operated.

In such an installation, the following requirements should be fulfilled:

- The appropriate spillage tests must be undertaken
- The wood heating appliance must be connected directly to the outside air supply
- The heat recovery must be adjusted to have a positive overpressure
- After installation of the appliance, it should be tested to ensure that the system works correctly when the door is open for re-fueling
- In case of failure of the heat recovery system, the wood heating appliance can only be operated with the door closed.
