

CONGRATULATIONS! You've purchased a Stretch Tent!

Where there
is moisture,
mould will
grow!

We are sure you would like to know how to get the MAXIMUM USE OUT OF IT!

Follow these 8 simple hints from our knowledgeable tent guru's...

First off, we are happy to remind you that **ALL OUR TENTS ARE IMPREGNATED WITH AN ANTI-MOULD AND ANTI-FUNGAL TREATMENT**, using the Ultra Fresh antimicrobial product. This is the leading fabric antimicrobial treatment available. It does inhibit the growth of bacteria and fungi, however it does not remove entirely the potential for the formation of mould or fungi growth on any fabric.

By using these few simple steps, you will **reduce the risk of damage and increase the life of the fabric** so you can enjoy your Stretch Tent for many years.

1 Always ensure the tent is packed away **COMPLETELY DRY**

3 The main place you will find moisture is the webbing loops and the stitching which take longer to dry than the main body of the tent

5 Pack your tent away in a cool dry place. If it is left in a hot place, the bag can sweat and cause moisture even though the tent is dry

7 Pack the tent away folded as neatly as possible. This way, there can be no spots in the tent where warm air can be trapped

2 While the fabric itself may seem dry, there can be some moisture trapped in the reinforcing strip around the edge

4 Try and pack away your tent later in the morning or afternoon so it has a chance to dry properly. Even if it has not rained, there may still be some precipitation on the tent

6 Leave the bag UNZIPPED so it can breathe

8 If your tent is going to be stored for a long period, try and pull it out and check occasionally as the earlier you find any problems, the easier it will be to clean
