Application Specific **DW440** Brushless Pump with Controller

C102 Single-Speed/Dual-Speed Controller. Single-Speed is the simple 100% duty cycle “constant on”, Dual-Speed allows you to operate the DW440 at low duty cycle during normal driving conditions and full duty cycle during high load conditions.

C103 PWM modulated controller allows your DW440 to be fully controlled by your existing OE or aftermarket fuel pump control module’s PWM signal.

QUALITY & INNOVATION

- 440LPH at 40psi 13.8v
- 620LPH at 40psi 20.0v
- Compatible with all fuels including methanol and e100
- Single-speed/Dual-speed, or PWM controller options
- No brushes + No commutator = Ultimate Durability

Compact Size – The DW440 measures 4-inches from inlet to outlet, opening up lots of fitment options that did not previously exist for customers wanting to integrate brushless pumps into their fuel system.

Bulkhead Wiring – Brushless pumps require a 4-wire connector for digital control. The DW440 pump kits include a bulkhead harness that allows pass-thru of the 4-wire system via a small 10mm hole which is easily added to an OE module top-hat.

Venturi Outlet – Most modern pump modules utilize a “venturi jet” system to prevent fuel starvation at low tank levels and high G cornering/acceleration. The DW440 has an integrated 6mm outlet to drive these systems.

*fitment kits include all necessary hoses, clamps, filters, and electrical connectors.

Need more information? All Part Numbers, Product Information, Technical Sheets, and Photos are available for export in PDM-Automotive.
