ABOUT US / CATALOG EXPLANATION

Your FME and safety products delivered to you fast! | 24/7 Support | Energy Safety Supply | Woman Owned | Trusted Safety Specialists Since 2020

For immediate assistance - go to [EnergySafetySupply.com](https://www.EnergySafetySupply.com) and click on the chat bubble in the bottom right - 24/7 Support

Please note that we have over 1400 SKUs. This catalog is just a small representation of our entire catalog. To save space we did not list most size options and color options.

This catalog is intended to give you an idea of all the products that we carry. For our full offering visit our website and search for a generic term for the item you are looking for.

We specialize in sourcing items at a wholesale price. Because we are a woman owned business we can get the best deals. We are able to get distributor pricing and only mark up items 5-10%.

FOREIGN MATERIAL EXCLUSION

Ask anyone who has gotten sick or injured without health insurance and you'll know how it feels for a company without an FME program. Prevention is the key to protecting your people, and accelerating your business.

THE COST OF FOREIGN MATERIAL ACCIDENTS

Worker Injury: Worker injuries are not only extremely expensive, but damaging to team morale and team productivity. They are the most important reason to implement FME procedures.

Damaged Equipment: Damaged equipment is costly to repair. Preventing foreign material from entering engines and foreign debris from entering machinery will save significant money.

Outages / Downtime: Lost production time to fix equipment and retrieve lost items is one of the most costly aspects of sub-par foreign material exclusion controls.

DROPPED OBJECTS PREVENTION

TOOL TETHERING
PROCEDURE

PURPOSE:

Eliminate the hazards of dropped objects on site with a specific focus on proper tool tethering practices and techniques.

SCOPE:

This procedure applies to all work that presents a drop hazard, including but not limited to work at heights and work where tools may be lifted to heights. It applies to all personnel directly and indirectly involved with dropped object environments.

DEFINITIONS:

- a. **Anchor point** – The beginning point (human body or structure) at which a tether is attached and is relied upon to prevent a tool from dropping.
- b. **Anchor attachment** – Solutions that are applied to anchor points being used at height to create secure connection points for tool tethers.
- c. **Dropped object event** – Any occurrence of a loss of control of an object. This includes and any instance where that object fell to a lower level, fell to the deck, or even if it fell and was stopped by a tool tether.
- d. **Drop Hazard** – The danger of injury, death or damage to equipment that exists in environments where objects have the potential to fall.
- e. **Tool attachment** – Solutions that are applied to tools being used at heights to create secure connection points for tool tethers.
- f. **Tool tether** – A length of material with at least one connector on each end that will connect a tool to an anchor.
- g. **Tool Tethering** - The process of using dropped object prevention products to prevent tools and equipment from falling, specifically using tool attachments, anchor attachments, tool tethers, and containers.

RESPONSIBILITIES

- a. **Management:**
 - i. Establish and maintain expectations regarding the prevention of dropped objects.
 - ii. Ensure up-to-date work-relevant training is made available to workers.
 - iii. Ensure workers have access to tool tethering supplies that support all worksite activities at height.
- b. **Safety:**
 - i. Ensure site personnel are trained to current expectations and relevant industry best practices.
 - ii. Ensure all employees are aware of on-site dropped objects procedures and processes including this one.
 - iii. Provide instruction, oversight, and coaching for proper dropped object prevention practices.
 - iv. Provide recommendations for tool tethering supplies to management
 - v. Periodically review the effectiveness of site dropped objects procedures and facilitate necessary changes.
- c. **All Workers:**
 - i. Prevent dropped objects.
 - ii. Identify and eliminate potential sources of dropped objects.
 - iii. Stop work when an unsafe condition exists.
 - iv. Report all dropped object events in accordance to this procedure.
 - v. Follow the requirements of this procedure.

WORK INSTRUCTION:

a. Training

- i. All workers working at height and any employees that support those activities should be trained in dropped object prevention practices.
- ii. Training consists of an initial course as well as periodic refreshers
- iii. Training curriculum should include the following topics at a minimum
 1. Current procedures
 2. The hazards of dropped tools
 3. Prevention methods and supplies
 4. Proper tool tethering application and use
 5. A practical, hands-on tool tethering exercise

b. Procurement

- i. The following considerations should be made when procuring tool tethering supplies.
 1. Applicable site and industry standards, such as OSHA and ANSI
 2. A range of tool attachments that will accommodate all tools used at height. Refer to Attachment 1 for common tool attachment pairings.
 3. Clear and concise labelling
- ii. When procuring hand tools for use at height ensure that design elements are chosen to reduce drop hazards.
 1. Grips integral to the tool.
 2. Hang holes safe for tool tether use, not having sharp edges that can abrade tool tethers.
 3. Attachment manufactured into tools or tools designed to easily accept a tool attachment product.

NOTE: Tools should not be modified using unapproved methods as tool integrity may be compromised. (for example, drilling through handles of tools is not an acceptable method of creating a tether attachment point)

c. Pre-Task

- i. All dropped object prevention supplies should be inspected prior to each use. See Attachment 2 for inspection criteria.
- ii. Work at height hazards should be evaluated prior to work using Attachment 3
- iii. All work that can be completed at ground level should be done prior to going to elevation. Reducing work done at height reduces the potential for dropped objects.
- iv. Ensure all tools are tether-ready prior to going to height.
- v. Tool Attachment Examples:

d. At-Height

- i. Tool tethers should meet the following criteria
 1. Not be loaded beyond the manufacturer's published weight rating
 2. Be used in accordance with all other manufacturer instructions
 3. Be as short as practical to reduce impact forces as well as to prevent swing hazards and impact with persons working below.
 4. Not be used in areas where snag hazards or rotating and operating equipment hazards have been determined to outweigh drop hazards.
 5. Be secured both to the tool and the anchor point whenever an object is in use. Holding one end of a tool tether in your hand is not proper tether use.
- ii. When transferring a tool from one location to another, such as out of a tethered tool bucket and onto a tool tether, be sure to always maintain 100% securing. For example, attach the tool tether to the attachment point before removing the existing tether.

- iii. Avoid using tool tethering products around sharp edges
- iv. Never daisy-chain tool tethers.
- v. Tool Tether Examples:

- vi. When selecting an anchor point be sure that location is truly fixed, meaning it will support the full drop force that may be exerted on a tether. Ladders and belt loops on jeans are examples of anchor locations that are not truly fixed.
- vii. Tools and equipment should be anchored to fixed structures whenever possible. The order of priority in picking anchor locations is as follows.
 1. Structure
 2. Waist - (Any center of mass connection such as a belt, harness, or vest)
 3. Wrist

- viii. If a person is selected as the anchor point (waist or wrist), then be sure to tether the smallest amount practical to the worker. It is important to understand that each worker is different and tether stopping forces can vary widely. General guidance is that no more than 6 lbs. should be tethered to a worker.
- ix. Anchor Attachment Examples:

IMPROPER USE:
DO NOT USE ON BELT LOOP

PROPER USE

IMPROPER USE:
DO NOT CINCH AROUND WRIST

- x. All items that don't have a practical way of tethering, such as small hardware and fasteners, should be contained while not in use. Tools and equipment that are able to be tethered should also be contained when not in active use.
- xi. Containers used for dropped object prevention should have one or more of the following criteria.
 1. Load rated closure system.
 2. Integral tethering for all stored tools.
- xii. Container Examples:

PROPER USE

INTERNAL VIEW OF POUCH

PROPER USE
TOOLS TETHERED

e. Additional Measures

- i. PPE – Proper protective equipment should always be worn on site as required by other procedures and on-site expectations. This protective equipment is also designed to minimize the impact of a dropped object.
- vi. Drop Barriers – Where applicable, passive products such as debris netting, toe boards, guardrails and other barriers should be used to prevent objects from falling.
- vii. Exclusion Zones – Any work areas or potential travel paths that are located under or around elevated work locations should be appropriately barricaded, and workers excluded from these locations. Should normal prevention methods fail, this ensures no one is present to be hit by an object.
- viii. Housekeeping – Clean as you go and keep the worksite organized. Reducing clutter will help prevent dropped objects.

Note: Additional measures outlined in this section are outlined for a basic overview. More specifics and details regarding these types of measures can be found in other site procedures or from general industry guidelines.

DROPPED OBJECT EVENT REPORTING

- a. Should a tool or object be dropped it should be immediately reported to supervision.
- b. The supervisor or designee should fill out a Dropped Objects Incident Report (Attachment 4)

ATTACHMENT 1 - COMMON TOOL ATTACHMENT PAIRINGS
