22 **Abstract**

23 Oxidative stress and inflammation are significant risk factors for
24 neurodegenerative disease. The Keap1-Nrf2-ARE pathway is one of the most
25 promising defensive systems against oxidative stress. Here, dozens of piperlongumine
26 analogues were designed, synthesized, and tested on PC12 cells to examine
27 neuroprotective effects against H₂O₂ and 6-OHDA induced damage. Among them, **6d**
28 was found to be able to alleviate the accumulation of ROS, inhibit the production of
29 NO and downregulate the level of IL-6, which indicated its potential antioxidant and
30 anti-inflammatory activity. Further studies proved that **6d** could activate Nrf2 signaling
31 pathway, induce the translocation of Nrf2 from cell cytosol to nucleus and upregulate
32 the related phase II antioxidant enzymes including NQO1, HO-1, GCLC, GCLM and
33 TrxR1. These results confirmed that **6d** exerted antioxidant and anti-inflammatory
34 activities by activating Nrf2 signaling pathway. Moreover, the parallel artificial
35 membrane permeability assay indicated that **6d** can cross the blood-brain barrier. In
36 general, **6d** is promising for further development as a therapeutic drug against
37 oxidative stress and inflammation related neurodegenerative disorders.

43

44 **1. Introduction**

45 Neurodegenerative diseases (ND), including Alzheimer's disease (AD),
46 Parkinson's disease (PD), and multiple Sexual sclerosis (MS), are general term for
47 diseases caused by chronic progressive degeneration of central nervous tissue [1 - 3].
48 These diseases have a common pathological feature, such as changes in the tissue
49 redox balance accompanied by the activation of microglial cells [4]. The pathological
50 processes of neurodegenerative diseases are associated with generation of reactive
51 oxygen species (ROS), which cause oxidative stress [5]. Oxidative stress is supposed
52 to play a key role in the development and progression of various diseases [5, 6]. For
53 AD, oxidative stress can aggravate the deposition of A β and phosphorylation of tau
54 protein, and promote A β and tau-mediated neurotoxicity. Furthermore, the presence of
55 A β and tau is also resulted in the increase of ROS [6, 7]. These consequences, however,
56 will further aggravate the oxidative stress response, which forms a vicious circle.
57 Moreover, oxidative stress leads to cellular dysfunction and demise, especially playing
58 a major role in the degeneration of dopaminergic neurons in the pathogenesis of PD [8].
59 Consequently, preventing ROS production and reducing oxidative stress may be a
60 crucial therapeutic target for ND treatment.

61 The Keap1-Nrf2-ARE system plays a key role in antioxidant and
62 anti-inflammatory mechanisms, which is one of the main cellular defense mechanisms
63 against oxidative stress. As a dominant regulator in cell, Nrf2 fights against oxidative
64 stress by activating anti-oxidative stress proteins, such as NQO1, GCLM, TrxR1, HO-1,
65 and GCLC, and phase II detoxification enzymes [8 - 11]. Recently, related studies have

66 shown that the Keap1-Nrf2-ARE pathway could be rapidly activated during the
67 development of neurodegenerative diseases [12], which is related to the production of
68 ROS. In addition, Nrf2 also regulates the expression of HO-1 to achieve
69 anti-inflammatory effect [13, 14]. In recent years, crystal structure of Keap1-
70 sulfhydryl composite has been published, and covalent modification of cysteine-rich
71 Keap1 protein by electrophilic molecules becomes an important strategy for the
72 activation of Nrf2 [14]. The modulators are classified into Michael acceptors, polyenes,
73 isothiocyanates, oxidizable, organosulfur compounds, trivalent arsenicals, diphenols,
74 heavy metal species and selenium-containing compounds [15]. Dimethyl fumarate
75 (Tecfidera) is the first Nrf2-inducer approved by FDA for the treatment of
76 remitting-relapsing multiple sclerosis [16, 17]. Thus, chemicals with an electrophilic
77 scaffold, especially α , β -unsaturated ketone structure, might be potent activators of
78 Nrf2 [18, 19]. Many natural products, such as resveratrol [20], butein [21], caffeic acid
79 [22] and curcumin [23], exhibit the potential to activate Nrf2. These scaffolds could
80 covalently bind to cysteine residues of Keap1, resulting in dissociation of Nrf2 from
81 Keap1, and translocation of Nrf2 from cytosol to the nucleus [24].

82 Piperlongumine (PL) is an alkaloid isolated from long pepper [25]. According to
83 previously published studies, PL could increase the ROS level in cancer cells [26].
84 Researchers have found that PL has protective effect against AD, such as lowering
85 cholinesterase levels, reducing neuroinflammation and inhibiting amyloid plaque
86 formation [27, 28]. Based on the previous research, several general structure-activity
87 relationships (SAR) have been identified. It reveals that the presence of 7, 8-olefin is

88 required. In addition, studies have shown that 2-chloro substitution may increase the
89 electrophilicity of 2, 3-olefins, thereby enhancing activity [29, 30]. But few
90 modifications on the position 2 and the lactam ring of PL were reported. In this study,
91 the lactam ring, the position 2 of PL, and the aromatic ring were changed to study the
92 SAR of PL. We reported herein the design, synthesis and biological evaluation of a
93 series of PL analogues.

94 2. Results and discussion

95 2.1 Chemistry

96 PL analogues were synthesized by coupling acyl chlorides and commercially
97 available lactams (**Scheme 1**) according to the published procedures with minor
98 modifications [10]. All target compounds were characterized by ^1H NMR, ^{13}C NMR,
99 and HRMS.

100 **Scheme 1.** Synthesis of PL analogs ^a

102

103 ^a Reagents and conditions: (a) NaH, THF, 0 °C, 30 min; (b) Trimethylacetyl chloride,

104 TEA, DCM, 0 °C, 30 min; (c) NaH, DCM, 0 °C, 30 min.

105 **2.2 Protection of PC12 cells against H₂O₂- and 6-OHDA-induced cell damage by PL**
 106 **analogues**

107 The cytotoxicity of all compounds toward the PC12 cells were determined by the
 108 MTT assay. As shown in **Figure S2**, **PL**, **PL-1**, **6a**, **6b**, **6i** and **6l** displayed significant
 109 toxicity to the cells at high concentration (50 μM), and there were no apparent toxicity
 110 of the other tested compounds toward the PC12 cells at 50 μM. Two classic cellular
 111 models, 6-OHDA and H₂O₂ induced PC12 cell damage models, were established to
 112 evaluate the neuroprotective effect of the target compounds [30]. The specific
 113 concentration of H₂O₂ (200 μM) and 6-OHDA (150 μM) were chosen for the further
 114 study, where cell viability was approximately 50%. (**Figure S1**).

115 The biological evaluation suggested that the 2, 3-position Michael acceptor
 116 moiety in **PL** could increase the cytotoxicity. When the *carbon atom* of the lactam ring
 117 of **PL** was replaced by the *nitrogen atom*, such as **PL-3** which showed better
 118 neuroprotection activity than that of **PL-2**. It was concluded that removing the α,

119 β -unsaturated in δ -valerolactam ring of PL could improve the neuroprotection. As
 120 expected, **PL-4** displayed lower cytotoxicity (**Figure S2A**) and better protection
 121 (**Figure 1**) in the initial screening. Few studies report the antioxidant activity of PL by
 122 replacing its lactam ring with 2-imidazolidone structures. We paid our attention on the
 123 modifications of the PL lactam with substituted imidazolidones, and **PL-4** was selected
 124 as a leading compound for the follow-up studies.

125
 126 **Figure 1** Initial screening of PL analogues against 6-OHDA- or H₂O₂-induced PC12
 127 cell damage. Data are the mean \pm SD of three independent experiments. (**p) \leq 0.01
 128 compared with the control group; (^p) \leq 0.05 compared with H₂O₂-treated or
 129 6-OHDA-treated group.

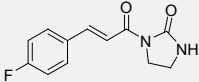

131 **Figure 2.** The docking models of icompond **1** (A) and **6** (B) with the BTB domain of
132 Keap1 (PDB: 4CXT).

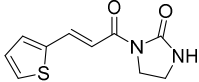

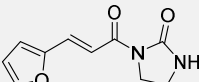

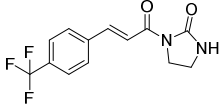

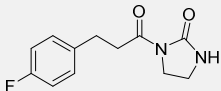

133 Glide program in Schrodinger was utilized to predict the potential binding model
134 between **1** and Keap1 BTB domain (**Figure 2A**). The covalent docking results showed
135 that **1** could form a covalently bond with residue CYS151 of Keap1, the benzene ring
136 from **1** formed π - π stacking with residue HIE154, and the carbonyl group from the α ,
137 β -unsaturated ketone and the lactam carbonyl group formed hydrogen bonds with
138 residues GLY148, LYS131 and GLY145. The docking results displayed that the residue
139 LYS150 as a hydrogen bond donor around the interface pocket is very close to the
140 ligand. With this in mind, compound **6** having a hydrogen bond acceptor was designed,
141 and the docking result showed that the added pivaloyl fragment did form hydrogen
142 bond with residue LYS150 (**Figure 2B**). In this point, compounds **1**, **2**, **3** and **4** without
143 pivaloyl and compounds **6**, **15**, **20** and **21** with pivaloyl were designed and synthesized.
144 The experimental results showed that the added pivaloyl play crucial roles in their
145 neuroprotective activities (**6**, **15**, **20** and **21** vs. **1**, **4**, **3** and **2**, **Tables 1** and **2**). To
146 further verify the influence of added pivaloyl to the expression of Nrf2. PC12 cells
147 were treated with compounds **1** and **6** for 24 h, and the expression of Nrf2 was detected
148 by western blot. As showed in **Figure 3**, the expression of Nrf2 was significantly
149 upregulated, and the upregulation of Nrf2 by **6** was more obvious than that of
150 compound **1**. The results suggested that the pivaloyl group is vital to activate Nrf2.

151 To validate the SAR, a variety of additional aryl analogues (**1** - **28**) with different
152 benzyl groups varying from *para* and *ortho* to *meta* substituents were synthesized

153 (Tables 1 and 2). All the target compounds showed negligible cytotoxicity (Figure
 154 S2A). Different substituted groups were introduced to phenyl. The 4'-F substituted
 155 compound 6 exhibited potent neuroprotection with cell viability (73.58%) better than
 156 that of 14 and 13 (4'-F > 2'-F > 3'-F). The 4'-Cl substituted 8 exhibited potent
 157 neuroprotection better than that of 17 and 18 (4'-Cl > 2'-Cl > 3'-Cl). It is well known
 158 that the majority nature of heterocycles is served as hydrogen bond donors and
 159 receptors. In this study, heterocycles were utilized to replace the aromatic group in the
 160 scaffold of PL. Several compounds substituted by furan (20), thiophene (21), pyridine
 161 (22), naphthalene (24), 1, 3-benzodioxole (25) were synthesized. Unfortunately, the
 162 neuroprotection was not improved compared to the compounds containing phenyl.
 163 Among the tested compounds, the compounds with electron-withdrawing groups
 164 showed better neuroprotective activity than that with the electron-donating groups. The
 165 monosubstituted compounds 6 (73.58%), 13 (70.97%) and 14 (72.43%) show better
 166 neuroprotective activity than the polysubstituted compounds 16 (63.55%) and 26
 167 (59.15%). It is remarkable that 6 showed best protection against 6-OHDA and H₂O₂
 168 induced PC12 cell damage (Tables 1 and 2).

169 **Table 1** The neuroprotection of PL analogues substituted with different aryl group

Compd.	Structure	Cell viability (%)

14		72.43 ± 2.54	72.33 ± 1.20	26		59.15 ± 4.34	56.38 ± 5.36
15		72.5 ± 2.88	71.12 ± 3.40	27		73.22 ± 2.73	72.13 ± 6.40
16		63.55 ± 1.64	61.77 ± 2.54	28		72.65 ± 4.48	71.21 ± 2.62

175 ^a Cell viability (%) of PC12 cells were detected by the MTT assay after 24 h of
 176 incubation with compounds at the concentration of 20 μ M with H₂O₂ (200 μ M) or
 177 6-OHDA (150 μ M). Data are the mean \pm SD of three independent experiments.

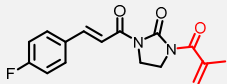

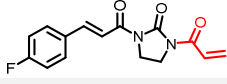

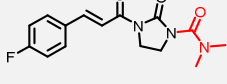

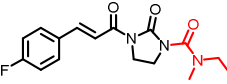

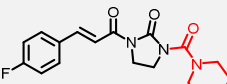

178
 179 **Figure 3** The expression of Nrf2 in PC12 cells after treatment with compounds **1** and **6**.
 180 (**p) \leq 0.05, Data are presented by mean \pm SD (n = 3).

181 As exhibited in **Table 3**, compounds **6a**, **6b**, **6i**, and **6l** displayed obvious
 182 cytotoxicity at low concentrations (**Figure S2B**). In addition, their neuroprotective
 183 effect were eliminated or weakened, which may be related to their toxicity. When the
 184 position 2 of *N*-terminus was connected to the aromatic structure, such as **6k**, **6l** and **6j**,
 185 the neuroprotective effects of them were reduced. When carbonyl was connected to

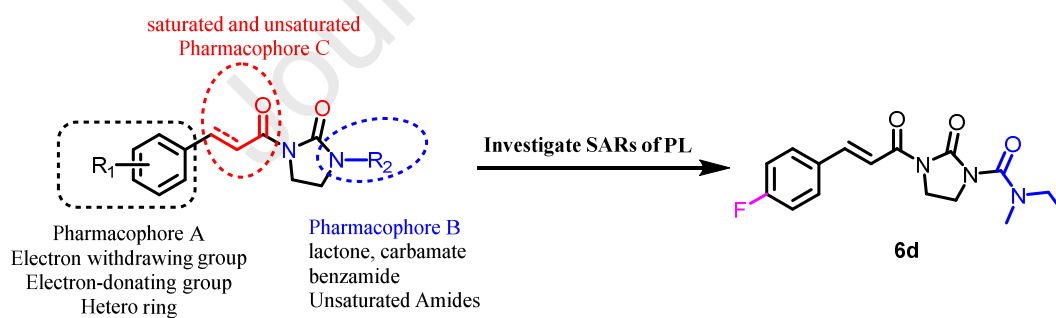

186 piperidine (**6e**), *N,N*-dimethyl (**6c**) and *N*-methyl, *N*-ethyl (**6d**), the neuroprotective
 187 effects were significantly enhanced. It is remarkable that **6d** showed excellent
 188 neuroprotective effect (75.01%). To verify whether α , β -unsaturated ketone is an
 189 essential group for neuroprotection, compounds **PL-6**, **5** and **6m** were synthesized and
 190 evaluated their neuroprotective effects. As expected, compounds **PL-4** (68.80%), **1**
 191 (68.57%) and **6d** (75.01%) exhibited potency neuroprotective effect with cell viability
 192 better than that of **PL-6** (55.78%), **5** (53.56%) and **6m** (59.50%), respectively. In
 193 general, we synthesized a series of **PL** analogues following the strategy shown in
 194 **Figure 4** and evaluated their neuroprotective activities. Among them, **6d** showed lower
 195 cytotoxicity (**Figure S2B**), best neuroprotective effect (**Table 3**), and was chosen for
 196 the follow-up studies.

197 **Table 3** The neuroprotection of **PL** analogues substituted with different groups

198 ^a Cell viability (%) of PC12 cells were detected by the MTT assay after 24 h of
 199 incubation with compounds at the concentration of 20 μM with H₂O₂ (200 μM) or
 200 6-OHDA (150 μM). Data are the mean ± SD of three independent experiments.

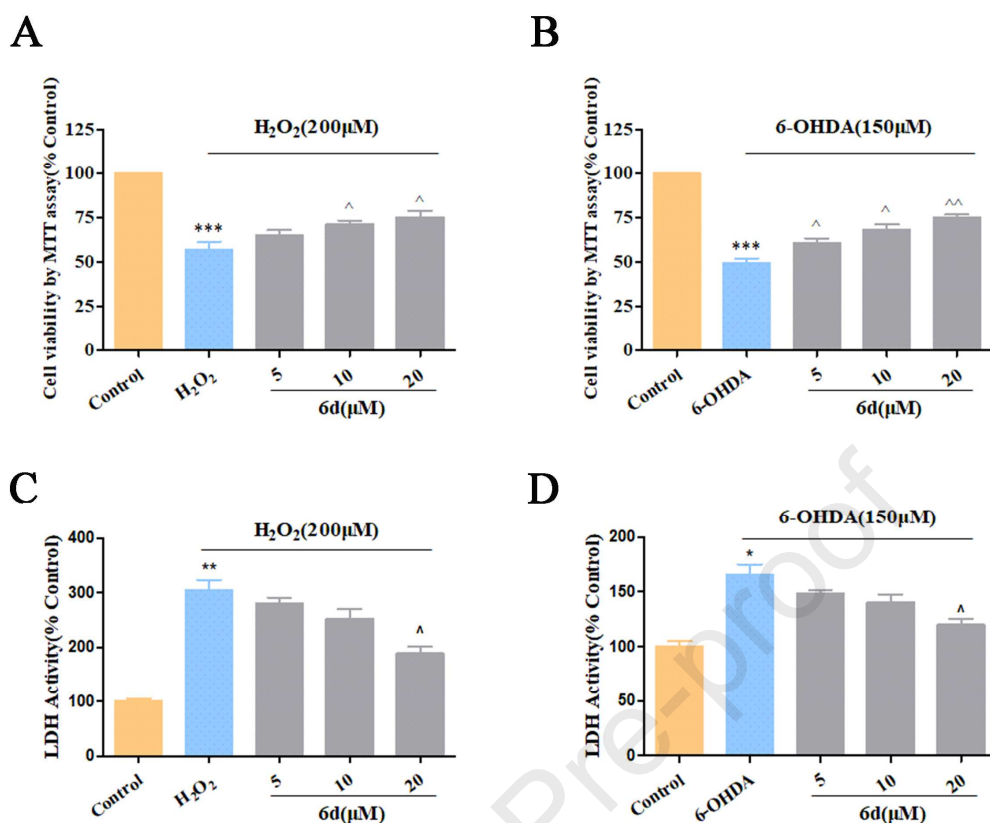

201

202 **Figure 4** The design of the modifications of PL203 **2.3. Antioxidant effect of 6d**

204 2.3.1. Defense of PC12 Cells against H₂O₂ or 6-OHDA induced cell damage in a dose
 205 dependent manner by **6d**

206 Initially, we investigated the cytotoxicity of all compounds on the PC12 cells (a
 207 rat pheochromocytoma cell line), BV2 cells (mouse microglia), and L02 cells (an

208 immortal hepatic). As shown in **Figure S3**, no apparent toxicity was observed at 50
209 μM . In **Figures 5A** and **5B**, compared with control group, cells pretreated with **6d** (5,
210 10 and 20 μM) for 24 h followed by treatment with H_2O_2 - and 6-OHDA exhibited
211 stronger viability in dose-dependent manners. Lactate dehydrogenase (LDH) is an
212 important indicator of membrane integrity [31]. To confirm the cytoprotection of **6d**,
213 the content of LDH leakage after H_2O_2 - or 6-OHDA-treated was determined. As shown
214 in **Figures 5C** and **5D**, the content of LDH was up-regulated by H_2O_2 or 6-OHDA, and
215 the release amount of LDH increased 2.8-fold and 1.8-fold that of the control
216 respectively, which was the same as the expected result. After pretreatment with **6d**,
217 the leakage of LDH was significantly reduced. The above results indicated that the
218 non-toxic concentration of **6d** could prevent the neurotoxicity induced by H_2O_2 and
219 6-OHDA in PC12 cells.

220
 221 **Figure 5.** Protection of **6d** against H₂O₂- (A) and 6-OHDA-induced (B) PC12 cell
 222 damage, determined by MTT assay. Protection of **6d** against H₂O₂-induced (C) and
 223 6-OHDA-induced (D) PC12 cell damage was measured by the LDH release assay.
 224 Data are the mean ± SD of three independent experiments. (**p) ≤ 0.01 and (***)p) ≤
 225 0.001 compared with the control group; (^p) ≤ 0.05, (^^p) ≤ 0.01 and (^^^p) ≤ 0.001
 226 compared with H₂O₂-treated or 6-OHDA-treated group.

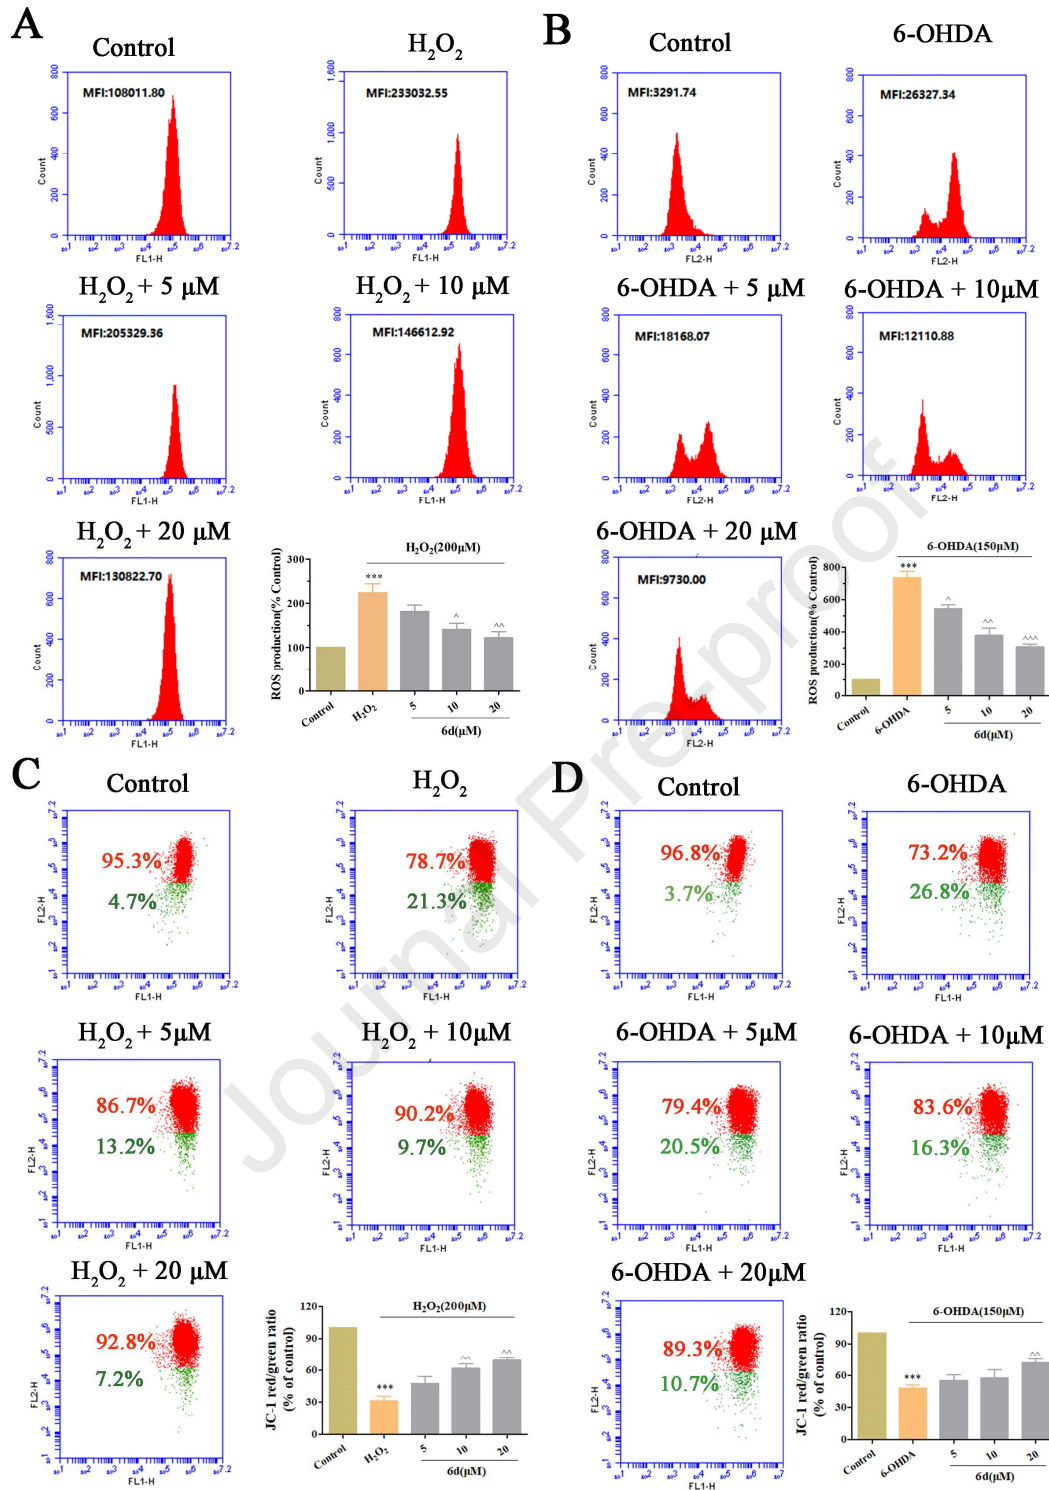

227 2.3.2 Prevention of ROS accumulation in PC12 cells

228 Oxidative stress response to ROS is a key initiator of oxidative damage induced
 229 by H₂O₂ and 6-OHDA. In order to study the protection of **6d** to the oxidative damage
 230 in PC12 cells, the level of ROS was quantified by dichlorofluorescein diacetate
 231 (DCFH-DA) using flow cytometry [32, 33]. When PC12 cells were exposed to H₂O₂ or

232 6-OHDA, the intracellular ROS fluorescence intensity increased significantly.
233 However, when pretreated with an increasing concentration of **6d** (5, 10 and 20 μM),
234 the ROS levels decreased in a dose-dependent manner (**Figures 6A** and **6B**). The result
235 suggested that **6d** effectively reduced H_2O_2 - and 6-OHDA-induced ROS accumulation.

236 *2.3.3 Alleviation of H_2O_2 - and 6-OHDA-induced intracellular mitochondrial* 237 *dysfunction by **6d***

238 Mitochondria are important mediators of cell metabolism and main producers of
239 ROS. The reduction of mitochondrial membrane potential (MMP) is a sign of early
240 apoptosis. The reduction of cell membrane potential can be detected by the red
241 fluorescence of JC-1 converted to green fluorescence [34]. **Figures 6C** and **6D** showed
242 that H_2O_2 and 6-OHDA reduced the MMP of PC12 cells, indicating that H_2O_2 - and
243 6-OHDA caused the mitochondrial dysfunction. In contrast, pretreatment of PC12 cells
244 with **6d** before exposure to H_2O_2 or 6-OHDA could significantly increase the MMP.
245 These results showed that **6d** had potent protection against H_2O_2 - or 6-OHDA-induced
246 mitochondrial dysfunction in PC12 cells.

247

248 **Figure 6.** The effects of **6d** on H_2O_2 -induced (A) and 6-OHDA-induced (B)

249 intracellular ROS production in PC12 cells. The cells were stained with DCFH-DA and

250 immediately determined by flow cytometry. The effects of **6d** on H_2O_2 -induced (C)

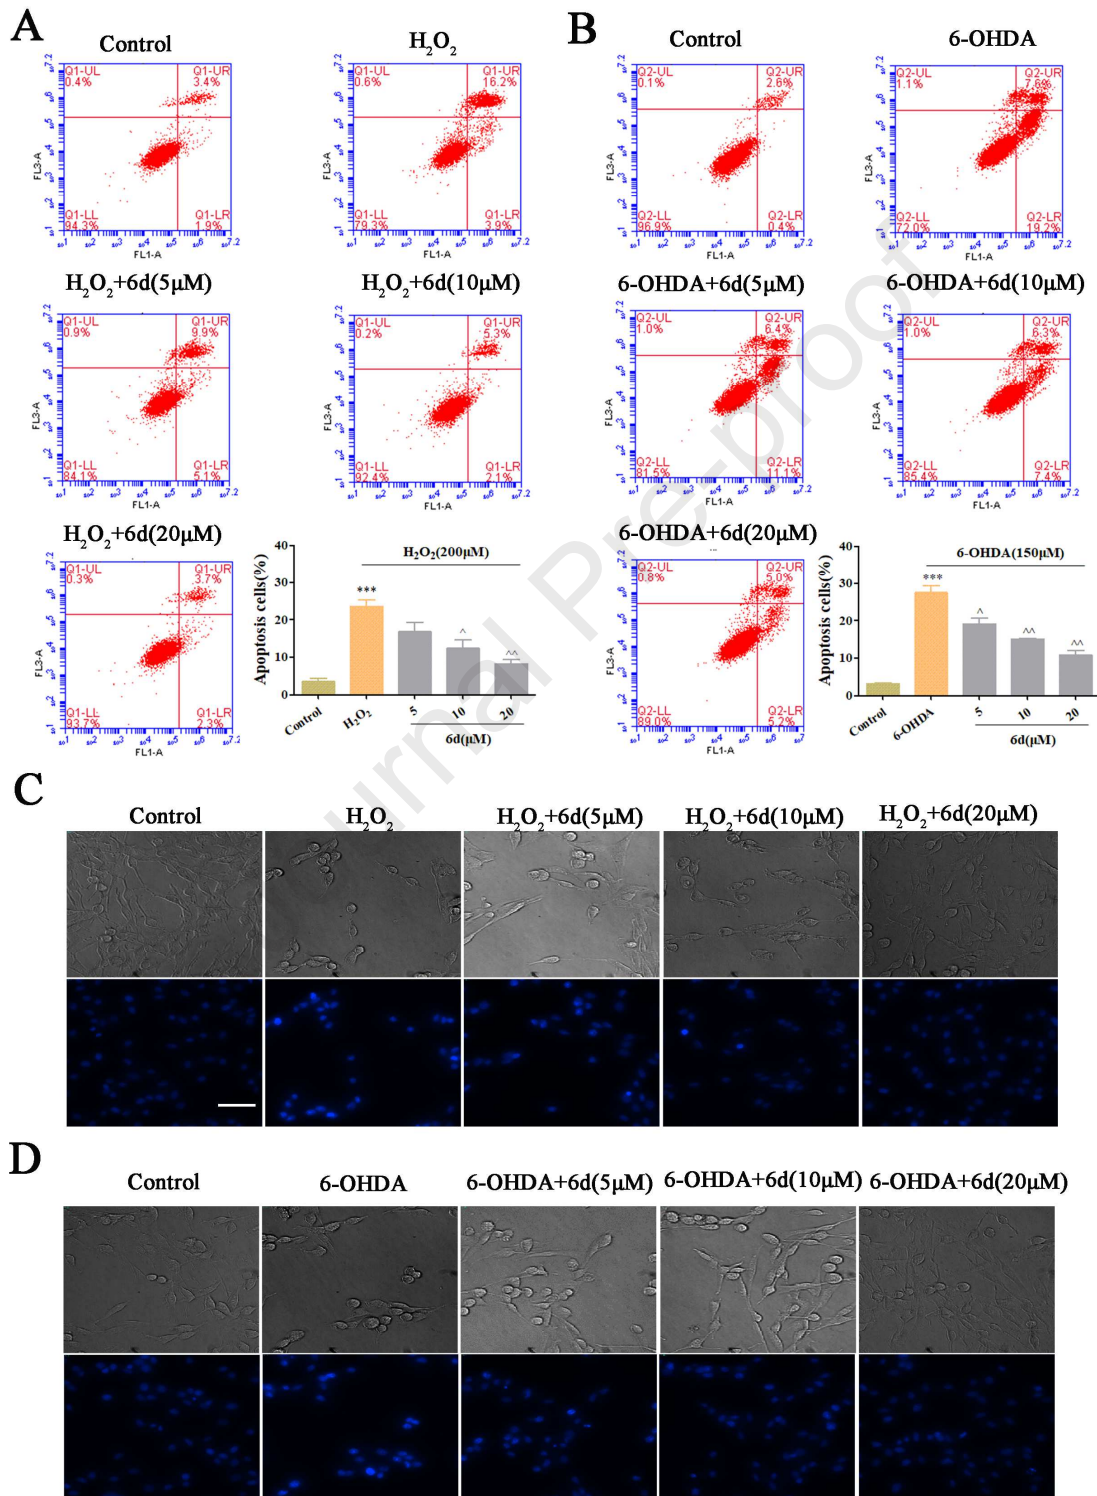

251 and 6-OHDA-induced (D) MMP reduction in PC12 cells. MMP were detected by flow
252 cytometry after JC-1 staining. Data are presented by mean \pm SD (n = 3). (***) $p \leq$
253 0.001 compared with the control group; (\wedge p) \leq 0.05, (\wedge p) \leq 0.01 and ($\wedge\wedge$ p) \leq 0.001
254 compared with H₂O₂-treated or 6-OHDA-treated group.

255 2.3.4 Alleviation of H₂O₂- and 6-OHDA-induced PC12 cell apoptosis

256 To investigate the anti-apoptosis ability of **6d** against H₂O₂- and
257 6-OHDA-induced cell damage, quantified Annexin V-FITC and propidium iodide (PI)
258 were used to evaluate apoptotic cells by flow cytometry [35]. As shown in **Figure 7A**,
259 compared with the control group, the apoptosis rate of PC12 cells increased from
260 5.71% (control group) to 25.38% (H₂O₂ treated group) after treatment with H₂O₂ for 24
261 h. In contrast, the rates of apoptotic cells were significantly reduced when H₂O₂-treated
262 PC12 cells were co-incubated with **6d** (5, 10 and 20 μ M), the cell apoptosis rate was
263 reduced to 16.45%, 7.62%, and 6.52%, respectively. Similarly, in **Figure 7B**, the
264 apoptosis rate of PC12 cells increased from 3.23% (control group) to 27.5% (6-OHDA
265 treated group) after treatment with 6-OHDA for 24 h, and the cell apoptosis rate was
266 reduced to 19.17%, 15.07%, and 10.83% after the cells were pretreated with **6d** (5, 10
267 and 20 μ M).

268 Hoechst 33342 is a blue fluorescent dye that can penetrate cell membranes and is
269 commonly used to detect apoptosis. After staining, images were captured using a
270 high-content imaging system. As shown in **Figures 7C** and **7D**, both H₂O₂ and
271 6-OHDA could cause PC12 cell apoptosis. The apoptotic nuclei were characterized by
272 highly fluorescent aggregates, while no obvious apoptotic nuclei were observed in the

273 control group. Pretreatment of cells with **6d** significantly reduced the number of
 274 apoptotic nuclei, which indicated that **6d** showed significant neuroprotective effect
 275 against H₂O₂- and 6-OHDA-induced apoptosis.

276

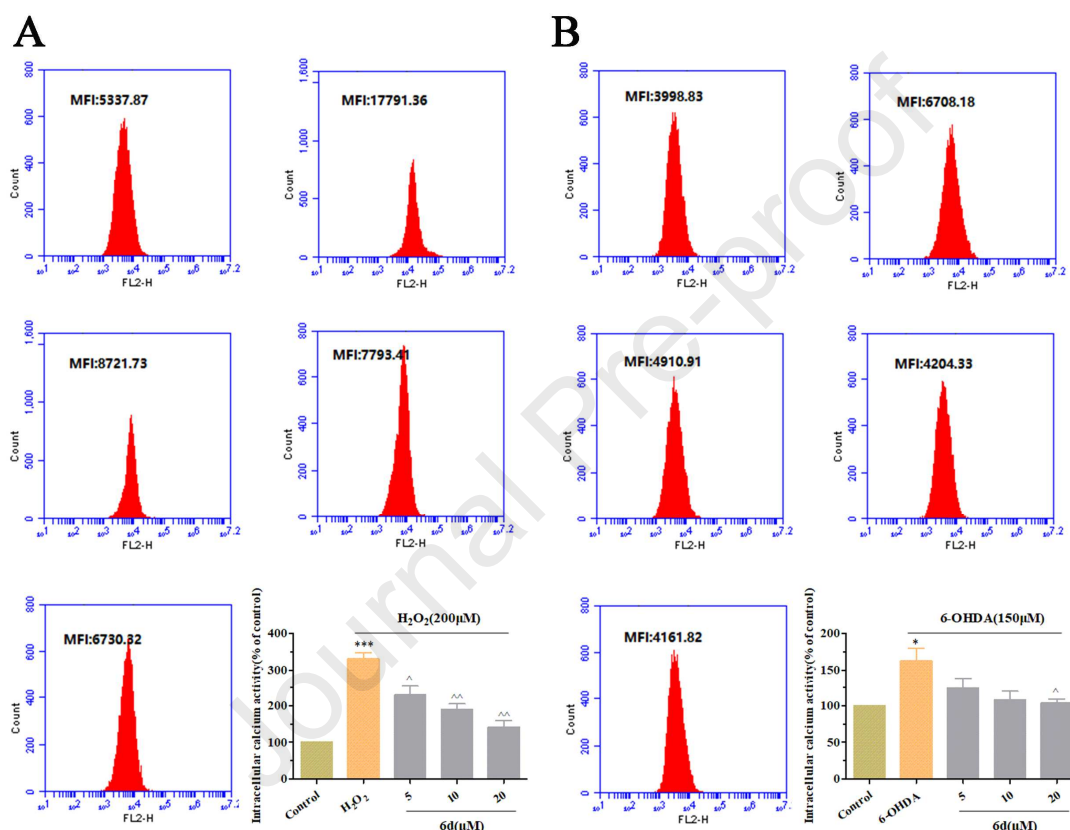

277 **Figure 7.** Prevention of PC12 cells from H₂O₂-induced (A) and 6-OHDA-induced (B)

278 apoptosis by **6d**. Apoptotic cells were detected by flow cytometry after AnnexinV and
279 PI double staining. (C, D) Images showed the apoptotic nuclei by Hoechst 33342
280 staining. The top panel is phase contrast pictures, and the bottom panel is fluorescent
281 pictures. Scale bars: 100 μm . Data are presented by mean \pm SD (n = 3). (***) $p \leq 0.001$
282 compared with the control group; (\wedge p) ≤ 0.05 and ($\wedge\wedge$ p) ≤ 0.01 compared with H₂O₂- or
283 6-OHDA-treated group.

284 2.3.5 The reduction of H₂O₂-induced and 6-OHDA-induced Ca²⁺ overload on PC12 285 cells by **6d**

286 Increased ROS will react with cellular proteins, nucleic acids, *et al.*, to cause
287 cellular barriers to affect cellular Ca²⁺ influx. Ca²⁺ has been shown to mediate
288 cytotoxicity of oxidative stress. Fluo-3 AM fluorescent probe can be used to detect the
289 concentration of Ca²⁺ in the cell, and the relative intensity of Ca²⁺ is reflected by the
290 fluorescence intensity [36, 37]. After being stimulated with H₂O₂ or 6-OHDA for 24 h,
291 the intracellular Ca²⁺ was almost 3.3 times and 1.8 times, respectively (**Figures 8A, B**).
292 Compared with the control group, the intracellular free Ca²⁺ fluorescence value
293 increased from 5537.87 (control group) to 17791.36 (H₂O₂ treated group) after
294 treatment with H₂O₂ for 24 h. In contrast, pretreatment of PC12 cells with **6d** (5, 10
295 and 20 μM) before exposure to H₂O₂ sharply dropped the intracellular free Ca²⁺
296 fluorescence value to 8721.73, 7793.41, and 6730.32, respectively. Similarly, the
297 intracellular free Ca²⁺ fluorescence value increased from 3998.83 (control group) to
298 6708.18 (6-OHDA treated group) after treatment with 6-OHDA for 24 h. Pretreatment
299 of PC12 cells with **6d** (5, 10 and 20 μM) before exposure to 6-OHDA significantly

300 dropped the intracellular free Ca^{2+} fluorescence value to 4910.91, 4204.33, and
 301 4161.82, respectively. The experimental results showed that **6d** in PC12 cells could
 302 prevent 6-OHDA- or H_2O_2 -induced Ca^{2+} overload. It was in agreement with the results
 303 of ROS, MMP and apoptosis above, which suggested that **6d** could be used as a
 304 potential neuroprotective agent for the treatment of ND.

305
 306 **Figure 8.** Effects of **6d** on H_2O_2 -induced (A) and 6-OHDA-induced (B) Ca^{2+} overload
 307 in PC12 cells. Data are presented by mean \pm SD (n = 3). (*p) \leq 0.05 and (***) \leq
 308 0.001 compared with the control group; (\wedge p) \leq 0.05 and ($\wedge\wedge$ p) \leq 0.01 compared with
 309 H_2O_2 -treated or 6-OHDA-treated group.

310 2.3.6 The Activation of the Keap1-Nrf2-ARE Pathway and the Induction of the 311 Downstream Antioxidant Proteins Expression in PC12 Cells by **6d**

312 As confirmed above, **6d** showed potent protection on PC12 cells against

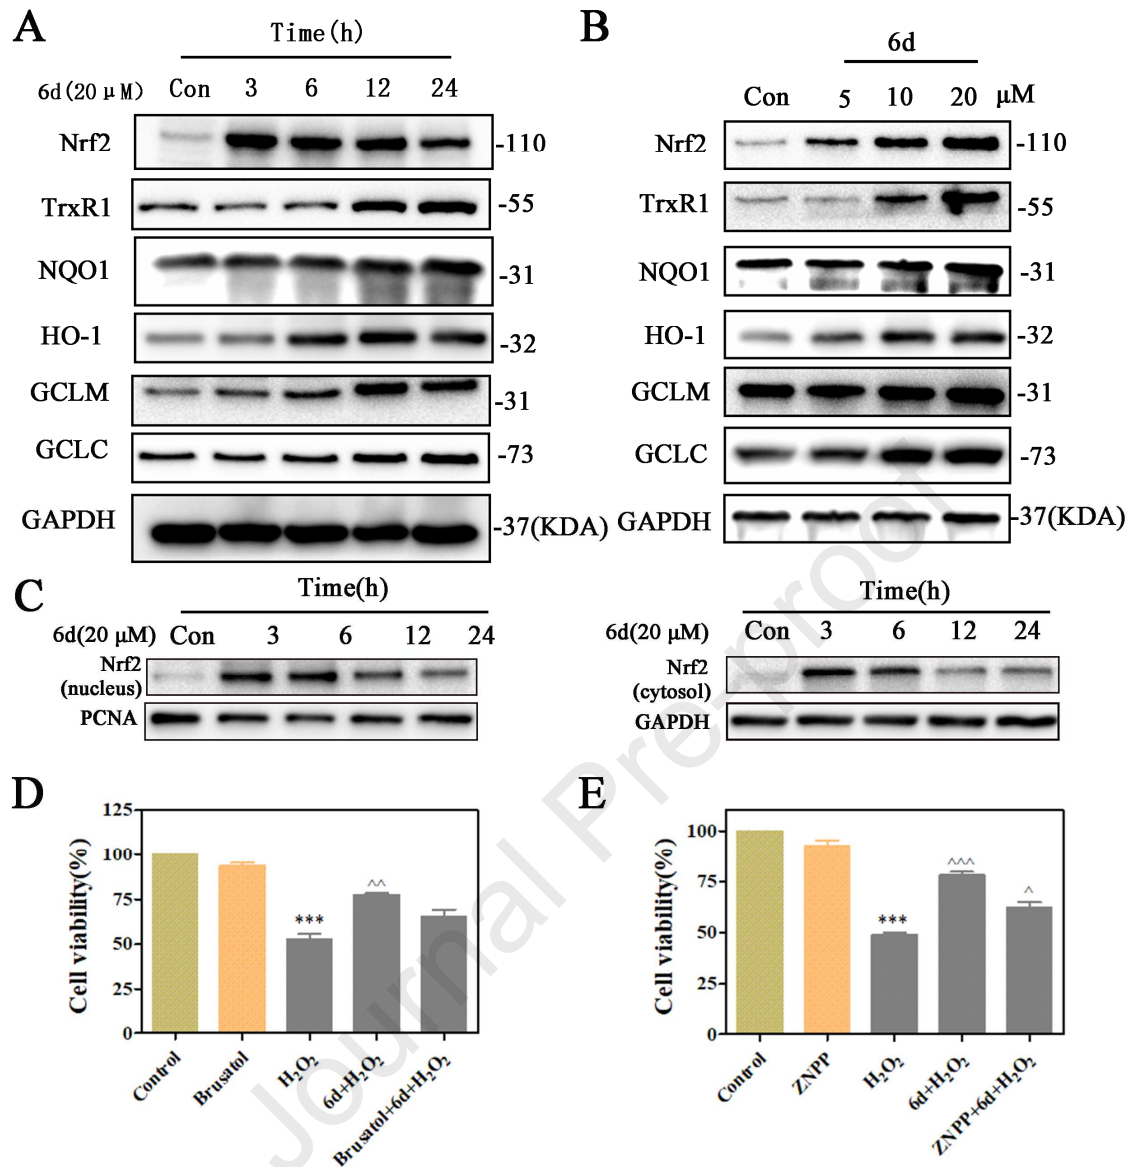

313 6-OHDA- or H₂O₂-induced cell damage, alleviated ROS accumulation, mitochondrial
314 dysfunction, Ca²⁺ influx, and cell apoptosis. We hypothesized that the antioxidant
315 activities of **6d** is related to the activation of Nrf2. To verify whether **6d** could activate
316 the Nrf2-Keap1-ARE pathway, the expression of Nrf2 and its downstream antioxidant
317 proteins were detected by Western blot. The protein level for Nrf2 was maximal after a
318 3 h treatment of with the highest concentration **6d** (20 μM), the protein levels for HO-1,
319 GCLM reached maximum at 12 h, and the protein levels for TrxR1, NQO1 and GCLC
320 reached maximum at 24 h (**Figure 9A**). Western blot analysis demonstrated that
321 treatment with **6d** for 24 h resulted in a remarkable increase of the Nrf2-regulated
322 proteins (NQO1, HO-1, TrxR1, GCLM, and GCLC) in a dose-dependent manner
323 (**Figure 9B**) [38].

324 DPPH (diphenyl-1-picrylhydrazyl) and ABTS radical scavenging method was
325 used to assess the antioxidant activities of these compounds in vitro, where Trolox was
326 used as a positive [39, 40]. **6d** is incapable of intercepting either DPPH or ABTS free
327 radicals (**Figure S4**), which indicated that **6d** exerted neuroprotective effect as an
328 activator rather than direct radical scavenger.

329 The translocation of Nrf2 from cytosol to nucleus is prerequisite for the
330 expression of Nrf2-dependent proteins. To confirm that whether **6d** could transfer Nrf2
331 from the cytoplasm to the nucleus. First, we checked the nuclear and cytoplasmic Nrf2
332 expression. Nuclear Nrf2 accumulation increased maximally at 6 h. Cytosol Nrf2
333 accumulation increased maximally at 3 h and declined after 6 h. These results indicated
334 that **6d** promoted the transfer of Nrf2 to the nucleus, which facilitates the binding of

335 Nrf2 to ARE for the transcription process. (**Figure 9C**) [41]. Besides, to confirm
336 whether **6d** exerted the anti-inflammatory or antioxidant activity by activating Nrf2
337 signaling pathway, antioxidant assay was performed with the existence of Nrf2
338 inhibitor brusatol or the HO-1 inhibitor zinc protoporphyrin IX (ZnPP) existed [30]. As
339 shown in **Figures 9D** and **9E**, **6d** alleviated the H₂O₂ or 6-OHDA induced cell death at
340 20 μM, while this neuroprotective effect was almost abolished in the group pretreated
341 with brusatol or ZNPP. This result demonstrated that Nrf2 was essential for the
342 neuroprotective effect of **6d** in PC12 cells.

343

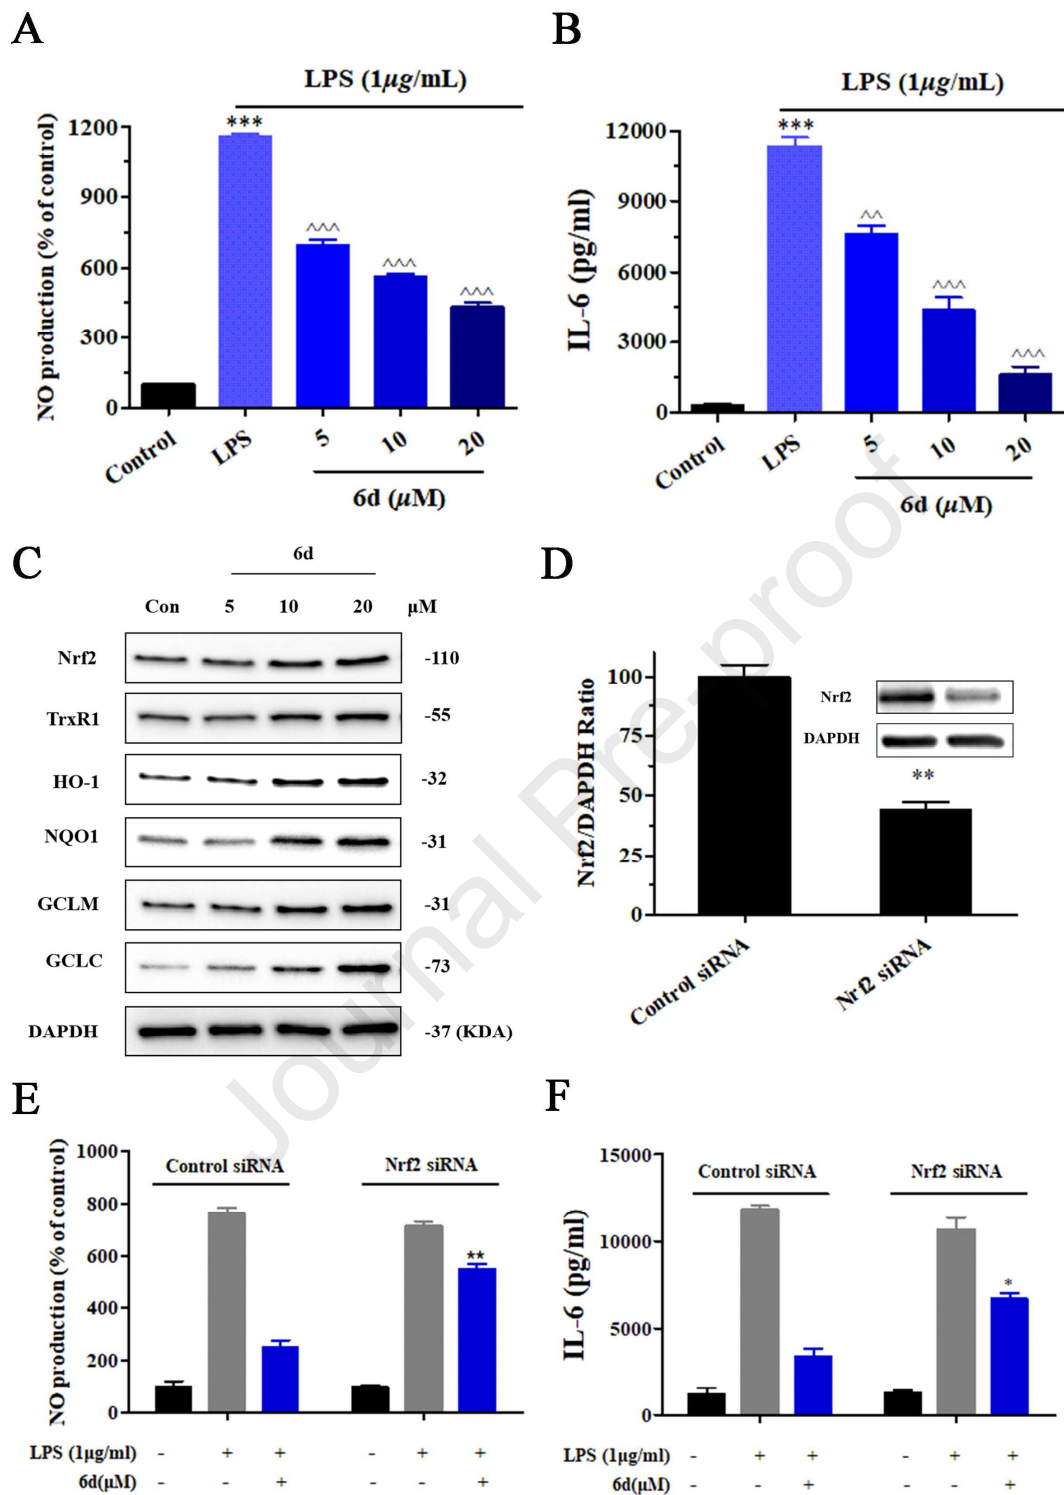

344
 345 **Figure 9.** 6d could increase the expression of nuclear and cytosolic Nrf2, TrxR1,
 346 NQO-1, HO-1, GCLM and GCLC in a time (A) and dose (B) dependent manner.
 347 Promotion of Nrf2 nuclear accumulation by 6d (C). Brusatol (D), ZnPP (E) affected
 348 the protection of 6d. PC12 cells were incubated for 30 min in the presence of 6d (20
 349 μM) together with brusatol (10 nM) or ZNPP (10 nM) prior to stimulation with H₂O₂
 350 (150 μM) for 24 h, determined by MTT assay. Data are presented by mean ± SD (n =
 351 3).

352 **2.4 Anti-inflammatory effect of 6d**

353 The excessive activation of microglia plays an important part in neuronal damage
354 and death caused by AD and PD neuroinflammation [42]. NO release is a vital feature
355 of microglia activation. Excessive NO production can cause inflammation [43].
356 Besides, many researchers believe that HO-1 regulates the inflammatory process and is
357 related to the Nrf2 / ARE pathway [44 - 46]. Collectively, activating Nrf2 is an
358 excellent method to reduce the inflammatory process [46]. The anti-neuroinflammation
359 property was measured using the Griess method to examine the effects of **6d** on the
360 production of NO. The results showed that after the 18 h incubation with LPS
361 (1µg/mL), the level of NO increased sharply compared to the control group. However,
362 the levels of NO dose-dependently decreased when BV2 microglia cells were
363 pretreated with **6d** before exposed to LPS (**Figure 10A**). It is well known that the
364 release of inflammatory factors contributes to the development of inflammation. IL-6
365 is an important indicator to evaluate the activation degree of macrophages and the
366 progress of inflammatory response [47, 48]. **6d** significantly attenuated LPS-induced
367 production of IL-6 in BV2 microglia cells (**Figure 10B**). The potential
368 anti-inflammatory effect may be related to the activation of the Nrf2 signaling pathway.
369 We determined the expression of Nrf2 and its downstream anti-oxidant proteins using
370 Western blot. As shown in **Figure 10C**, treatment of BV2 microglia cells with **6d** for
371 24h could significantly upregulate the expression of these proteins with dose
372 dependent manner, which was similar with that in PC12 cells. Then, to investigate
373 whether activation of Nrf2 is responsible for the anti-inflammatory effect of **6d**, Nrf2

374 was knockdown by siRNA. Then the control siRNA- and Nrf2 siRNA-transfected BV2
375 microglia cells were pre-treated with **6d** (20 μ M) and stimulated with LPS for another
376 18 h. The level of Nrf2 decreased sharply in Nrf2 siRNA-transfected BV2 microglia
377 cells (**Figure 10D**). Furthermore, **6d** (20 μ M) could significantly reduce LPS-induced
378 NO production in control siRNA-transfected BV2 microglia cells (**Figure 10E**) [49 -
379 51]. However, the suppressive effects of **6d** (μ M) was obviously suppressed in Nrf2
380 siRNA-transfected BV2 microglia cells. Similar results were observed in experiments
381 to determine the effects of Nrf2 knockout on the inhibition of IL-6 production (**Figure**
382 **10F**). These results demonstrated that **6d** exerted anti-inflammatory effect with a
383 Nrf2-dependent manner in BV2 microglia cells.

384

385 **Figure 10.** Contribution of Nrf2 to the anti-inflammatory effect of **6d**. (A) **6d** reduced

386 the production of LPS-stimulated inflammatory mediators NO in BV2 microglia cells.

387 (B) **6d** reduced the production of LPS-induced IL-6 in BV2 microglia cells. The levels

388 of IL-6 were measured by ELISA kits. (C) **6d** dose dependently induced expression of
389 Nrf2 and its downstream antioxidant proteins in BV2 microglia cells. (D) Nrf2
390 expression in Control siRNA- and Nrf2 siRNA-transfected BV2 microglia cells. (***)
391 ≤ 0.001 compared with the control group; (\wedge p) ≤ 0.01 and ($\wedge\wedge$ p) ≤ 0.001 compared
392 with LPS-treated group. Transfection of BV2 microglia cells with Nrf2 siRNA
393 reversed suppressive effects of **6d** (20 μ M) on NO (E), IL-6 (F) production following
394 LPS stimulation. **p \leq 0.01 and *p \leq 0.05 in comparison with control siRNA-transfected
395 cells. Data are presented by mean \pm SD (n = 3).

396 **2.6 Molecular docking study between 6d and Keap1**

397 Keap1 has strict regulation on the activation of Nrf2. The oxidative or
398 electrophilic agents covalently bind to the cysteine-rich Keap1 protein, thereby
399 changing conformational of Keap1 to prevent the ubiquitination of Nrf2, thus activate
400 Keap1-Nrf2-ARE pathway. According to previous reports, other Michael receptors
401 may activate the Nrf2 pathway by reacting with CYS151 or other reactive cysteine
402 residues in Keap1 [4, 52]. Considering that α , β -unsaturated ketone of **6d** is a Michael
403 receptor moiety, which is possible to react with cysteine residues of keap1. So the
404 covalently docking study was performed used Glide based on the X-ray crystal
405 structure of BTB domain of KEAP1 in complex with CDDO (PDB: 4CXT) (**Figure**
406 **11**). The result of covalent docking showed that **6d** could covalently bonding with
407 CYS151 of Keap1, the benzene ring formed π - π stacking with residue HIE154, and the
408 carbonyl group of α , β -unsaturated ketone and carbonyl lactam formed hydrogen bonds
409 with residues GLY148, LYS131 and ARG135. The *N*-ethyl, *N*-methylformamide

410 fragment formed hydrogen bonds with LYS150. The above results suggested that **6d**
411 may covalently bind to Keap1, triggered the release of Nrf2 from Keap1, and further
412 promoted Nrf2 translocate into nucleus, where it binded to the ARE to initiate the
413 expression of Nrf2-dependent genes and
414 proteins.

415
416 **Figure 11.** The docking model of **6d** with representative CYS in Keap1. 3D image of
417 covalent docking between **6d** and CYS151 in the BTB domain (PDB: 4CXT).

418 **2.7 In vitro blood-brain barrier (BBB) permeation assay**

419 Favorable blood-brain barrier (BBB) permeability is essential property for a
420 central nervous system (CNS) drug. To verify whether **6d** can penetrate the blood-brain
421 barrier, PAMPA-BBB assay was used. This method is a fast and efficient method to
422 evaluate the BBB permeability, established by Di *et al*, and is widely used in the initial
423 screening of drugs [53]. Eight clinical drugs with different blood-brain barrier
424 permeability were selected to set up the model (**Table 4**). A plot of experimental data
425 versus bibliographic values gave a good linear correlation, $Pe (exp.) = 1.080Pe (bibl.)$
426 $+ 1.046$ ($R^2 = 0.9885$) (**Figure S5**). According to this equation and considering the
427 limit established by Di *et al*. for BBB permeation, it was concluded that compounds
428 with $Pe > 5.36 \times 10^{-6} \text{ cm s}^{-1}$ can be considered to show good BBB permeation (CNS +).

429 Based on the measured permeability ($Pe = (6.78 \pm 0.3) \times 10^{-6} \text{ cm s}^{-1} \text{ cm} / \text{ s}$), **6d** could
430 cross the BBB.

431 **3. Conclusion**

432 In conclusion, a series of novel Piperlongumine analogues as antioxidant and
433 anti-inflammatory agents was designed and synthesized. Among these analogues, **6d**
434 exhibited the most potent protective effect against 6-OHDA- or H_2O_2 - induced PC12
435 cell damage. The biological evaluation showed that **6d** is a neuroprotective compound
436 via alleviation or neutralization of ROS accumulation, mitochondrial dysfunction, cell
437 apoptosis and reduces Ca^{2+} overload. Notably, **6d** could reduce the production of NO
438 and IL-6 in LPS-stimulated BV2 microglia cells, indicating its potential
439 anti-inflammatory activity. ROS scavenging and cytoprotection effect of **6d** was
440 implemented by activating Nrf2 and upregulating related phase II antioxidant enzymes,
441 such as HO-1, NQO1, GCLM, GCLC, and TrxR1. We also checked the nuclear and
442 cytoplasmic expression of Nrf2, these results indicated that **6d** promoted the transfer of
443 Nrf2 to the nucleus. Interestingly, the protective effect of **6d** could be significantly
444 weakened by Nrf2 inhibitor brusatol or HO-1 inhibitor ZnPP at non-toxic
445 concentrations, confirming that the antioxidant and anti-inflammatory activity of **6d** is
446 related to the activation of Nrf2. The result of the parallel artificial membrane
447 permeability assay indicated that **6d** would be inclined to cross the BBB. These results,
448 together with the relative safety profile, indicated that **6d** is promising for further
449 development as a therapeutic drug against oxidative stress- and inflammation-related
450 neurodegenerative disorders.

451 **4. Experimental section**

452 **4.1. Chemistry**

453 All conventional reagents and solvents are purchased directly from commercial
454 companies and no further purification is required. Analytical thin-layer
455 chromatography was used to monitor the progress of the reaction on a pre-coated silica
456 gel GF254 plate (Qingdao Haiyang Chemical Plant, Qingdao, China), and to detect
457 spots under ultraviolet light (254 nm). After the reaction is worked up, the product is
458 isolated by rapid purification preparative liquid chromatography (Biotage, Isolera One,
459 Sweden). The melting point was measured with an XT-4 micro-melting point
460 instrument without correction. The ^1H NMR and ^{13}C NMR spectra were measured at
461 25 °C with a Bruker ACF-500 / 600 spectrometer, and reference was made to TMS.
462 The residual solvent line is designated as the internal standard, the chemical shift is
463 expressed in ppm (δ), and the split mode is designed as s, singlet; d, doublet; t, triplet;
464 m, multiplet. An Agilent 6520B Q-TOF mass spectrometer (Agilent Technologies,
465 Santa Clara, California, USA) was used for high-resolution electrospray ionization
466 (HRESI) mass spectrometry.

467 **4.2 Preparation**

468 **4.2.1 Preparation of compounds *PL-1~PL-6* and compounds *1-5***

469 The starting material, 5, 6-dihydro-1*H*-pyridin-2-one, 2-piperidone, propyleneurea,
470 2-imidazolidone and 2-piperazinone (1 equiv.) was added to tetrahydrofuran or
471 dichloromethane under nitrogen, and added NaH (3 equiv.) to the reaction mixture at
472 0 °C for 15 minutes. Then, (+) - cinnamyl chloride (1 equiv.) was added to the mixture

473 with stirring at 20 °C for 30 min. The reaction was quenched with saturated NaHCO₃
474 solution, and then extracted twice with ethyl acetate. The combined extracts were then
475 washed successively with H₂O, brine, and dried over anhydrous Na₂SO₄. After
476 concentration under reduced pressure, the residue was quickly purified by using a flash
477 silica gel column (PE / EtOAc).

478 *1-cinnamoyl-5,6-dihydropyridin-2(1H)-one (PL-1)*

479 Yield 64%, white powder. m.p. 95-97 °C. ¹H NMR (500 MHz, CDCl₃) δ 7.75 (d,
480 *J* = 15.7 Hz, 1H), 7.58 (dd, *J* = 5.2, 2.0 Hz, 2H), 7.52 (d, *J* = 15.5 Hz, 1H), 7.37 (dd, *J*
481 = 5.2, 2.0 Hz, 3H), 6.93 (dt, *J* = 9.7, 4.2 Hz, 1H), 6.05 (dt, *J* = 9.8, 1.9 Hz, 1H), 4.04 (t,
482 *J* = 6.5 Hz, 2H), 2.48 (m, *J* = 6.3, 4.1, 1.9 Hz, 2H). ¹³C NMR (125 MHz, CDCl₃) δ

518 4.2.2 General procedures for the preparation of (1-5)

519 Concentrated 2-Imidazolidone (1 equiv.) were added to absolute dichloromethane
520 under nitrogen, and added NaH (3 equiv.) to the reaction mixture was stirred at 0 °C for
521 15 minutes and then added to (+)-cinnamyl chloride with different substituents (1
522 equiv.) to the reaction mixture was stirred at 20 °C for 30 min. After the reaction was
523 completed, it was quenched with saturated $NaHCO_3$ solution, and then the mixed
524 liquid was extracted twice with ethyl acetate. The combined extracts were then washed
525 with H_2O and brine, and dried over anhydrous Na_2SO_4 . After concentration under
526 reduced pressure, the residue was quickly purified by using a silica gel column (PE /
527 EtOAc).

528 (*E*)-1-(3-(4-(trifluoromethyl) phenyl) acryloyl) imidazolidin-2-one (1)

563 4.2.3 General procedures for the preparation of **6-29**

564 Firstly, the cinnamic acid analogues (1 equiv.) with different substituents are
565 added, dropwise stir in triethylamine ice bath for 15 min. then add trimethylacetyl
566 chloride to protect the N-H at one end. After concentration under reduced pressure, the
567 residue was quickly purified by using a silica gel column (PE / EtOAc). Here, do not
568 contact water for reaction and products, and it needs to be quickly purified and
569 concentrated. Concentrated 2-imidazolidone (1 equiv.) were added to absolute
570 tetrahydrofuran or dichloromethane under nitrogen, and added NaH (3 equiv.) to the
571 reaction mixture was stirred at 0 °C for 15 minutes. Then add the above products to the
572 reaction mixture was stirred at 0 °C for 30 min. After the reaction was completed, used
573 quenching with saturated NaHCO₃ solution, and then the mixed liquid was extracted
574 twice with ethyl acetate. The combined extracts were then washed with H₂O and brine
575 and dried over anhydrous Na₂SO₄. After concentration under reduced pressure, the
576 residue was quickly purified by using a silica gel column (PE / EtOAc).

738 4.2.4 General procedures for the preparation of **6a-6n**

739 Concentrated (*E*)-1-(3-(4-fluorophenyl)acryloyl)imidazolidin-2-one (1 equiv.)
740 were added to absolute dichloromethane under nitrogen, and added NaH (3 equiv.) to
741 the reaction mixture was stirred at 0 °C for 15 minute and then added to small molecule
742 acid chloride(1 equiv.) to the reaction mixture was stirred at 20 °C for 30 min. After
743 the reaction was completed, used quenching with saturated NaHCO_3 solution, and then
744 the mixed liquid was extracted twice with ethyl acetate. The combined extracts were
745 then washed with H_2O and brine, and dried over anhydrous Na_2SO_4 . After
746 concentration under reduced pressure, the residue was quickly purified by using a
747 silica gel column (PE / EtOAc).

748 (*E*)-1-(3-(4-fluorophenyl) acryloyl)-3-methacryloylimidazolidin-2-one (**6a**)

749 Yield 22%, white powder. m.p. 165-167 °C. ^1H NMR (600 MHz, CDCl_3) δ 7.86
750 (d, $J = 16.2$ Hz, 1H), δ 7.83 (d, $J = 16.2$ Hz, 1H), 7.65 - 7.61 (m, 2H), 7.09 (t, $J = 8.6$
751 Hz, 2H), 5.47 - 5.46 (m, 1H), 5.42 (s, 1H), 4.04 - 4.01 (m, 2H), 3.94 - 3.91 (m, 2H),
752 2.12 - 2.09 (m, 3H). ^{13}C NMR (150 MHz, CDCl_3) δ 171.46, 164.13(d, $J_{c-f} = 250.35$
753 Hz), 163.29, 151.22, 144.78, 140.43, 130.56, 119.75, 117.35, 116.02 (d, $J_{c-f} = 21.9$ Hz),

754 39.41, 19.37. HRMS (ESI) m/z 325.0950 $[M+Na]^+$ (calcd for 325.0959,
755 $C_{16}H_{15}FN_2NaO_3$).

756 (*E*)-1-acryloyl-3-(3-(4-fluorophenyl) acryloyl) imidazolidin-2-one (**6b**)

757 Yield 29%, white powder. m.p. 149-150 °C. 1H NMR (500 MHz, $CDCl_3$) δ 7.84
758 (s, 2H), 7.65 – 7.59 (m, 2H), 7.51 (dd, $J = 17.0, 10.5$ Hz, 1H), 7.09 (t, $J = 8.6$ Hz, 2H),
759 6.57 (dd, $J = 17.0, 1.7$ Hz, 1H), 5.91 (dd, $J = 10.4, 1.8$ Hz, 1H), 4.01 - 3.97 (m, 2H),

781 (*E*)-1-(3-(4-fluorophenyl) acryloyl)-3-(piperidine-1-carbonyl) imidazolidin-2-one (**6e**)

782 Yield 21%, white powder. m.p. 108-109 °C. ^1H NMR (600 MHz, CDCl_3) δ 7.88
783 (dd, $J = 15.8, 1.6$ Hz, 1H), 7.82 (dd, $J = 15.8, 1.6$ Hz, 1H), 7.63 (dd, $J = 7.2, 2.1$ Hz,
784 2H), 7.09 (td, $J = 8.5, 1.7$ Hz, 2H), 3.99 (t, $J = 8.1$ Hz, 2H), 3.85 (d, $J = 8.0$ Hz, 2H),
785 3.53 (s, 4H), 1.68 (s, 6H). ^{13}C NMR (150 MHz, CDCl_3) δ 165.72, 163.99 (d, $J_{\text{c-f}}$
786 =249.9 Hz), 152.79, 152.31, 143.96, 131.07, 130.47, 117.71, 115.98 (d, $J_{\text{c-f}} = 22.5$ Hz),
787 40.73, 40.02, 31.45, 30.20, 24.31. HRMS (ESI) m/z 346.1554 $[\text{M}+\text{H}]^+$ (calcd for
788 346.1561, $\text{C}_{18}\text{H}_{21}\text{FN}_3\text{O}_3$).

789 (*E*)-1-acetyl-3-(3-(4-fluorophenyl) acryloyl) imidazolidin-2-one (**6f**)

790 Yield 19%, white powder. m.p. 204-205 °C. ^1H NMR (500 MHz, CDCl_3) δ 7.85
791 (s, 2H), 7.64 (dd, $J = 8.6, 5.5$ Hz, 2H), 7.11 (t, $J = 8.6$ Hz, 2H), 3.97 (dd, $J = 9.3, 5.5$
792 Hz, 2H), 3.90 (dd, $J = 9.3, 5.5$ Hz, 2H), 2.59 (s, 3H). ^{13}C NMR (126 MHz, CDCl_3) δ
793 170.81, 165.85, 164.12 (d, $J_{\text{c-f}} = 250.35$ Hz), 152.01, 144.55, 130.96, 130.44, 117.42,
794 116.07 (d, $J_{\text{c-f}} = 21.75$ Hz), 38.99, 38.66, 24.14. HRMS (ESI) m/z 299.0792 $[\text{M}+\text{Na}]^+$
795 (calcd for 299.0802, $\text{C}_{14}\text{H}_{13}\text{FN}_2\text{NaO}_3$).

796 (*E*)-1-(3-(4-fluorophenyl) acryloyl)-3-propionylimidazolidin-2-one (**6g**)

797 Yield 32%, white powder. m.p. 163-164 °C. ^1H NMR (500 MHz, CDCl_3) δ 7.86
798 (d, $J = 2.1$ Hz, 2H), 7.64 (dd, $J = 8.5, 5.5$ Hz, 2H), 7.11 (t, $J = 8.6$ Hz, 2H), 4.00 – 3.94
799 (m, 2H), 3.93 – 3.88 (m, 2H), 3.00 (q, $J = 7.3$ Hz, 2H), 1.23 (t, $J = 7.3$ Hz, 3H). ^{13}C
800 NMR (125 MHz, CDCl_3) δ 174.69, 165.88, 164.10 (d, $J_{c-f} = 250.25$ Hz), 151.94,
801 144.44, 130.96, 130.43, 117.51, 116.05 (d, $J_{c-f} = 21.75$ Hz), 39.10, 38.78, 29.74, 8.42.
802 HRMS (ESI) m/z 313.0949 $[\text{M}+\text{Na}]^+$ (calcd for 313.0959, $\text{C}_{15}\text{H}_{15}\text{FN}_2\text{NaO}_3$).
803 (*E*)-1-butyryl-3-(3-(4-fluorophenyl) acryloyl) imidazolidin-2-one (**6h**)

804 Yield 29%, white powder. m.p. 131-132 °C. ^1H NMR (500 MHz, CDCl_3) δ 7.85
805 (d, $J = 2.3$ Hz, 2H), 7.63 (dd, $J = 8.5, 5.5$ Hz, 2H), 7.10 (t, $J = 8.5$ Hz, 2H), 3.98 – 3.93
806 (m, 2H), 3.92 – 3.87 (m, 2H), 2.96 (t, $J = 7.4$ Hz, 2H), 1.74 (h, $J = 7.4$ Hz, 2H), 1.02 (t,
807 $J = 7.4$ Hz, 3H). ^{13}C NMR (125 MHz, CDCl_3) δ 173.82, 165.88, 164.09 (d, J_{c-f}
808 $= 250.02$ Hz), 151.89, 144.42, 130.98, 130.50, 117.52, 116.04 (d, $J_{c-f} = 21.75$ Hz), 39.05,
809 38.74, 38.01, 17.75, 13.75. HRMS (ESI) m/z 327.1105 $[\text{M}+\text{Na}]^+$ (calcd for 327.1115,
810 $\text{C}_{16}\text{H}_{17}\text{FN}_2\text{NaO}_3$).

811 (*E*)-1-(3-chloropropanoyl)-3-(3-(4-fluorophenyl) acryloyl) imidazolidin-2-one (**6i**)

812 Yield 26%, yellow powder. m.p. 190-192 °C. ^1H NMR (500 MHz, CDCl_3) δ 7.90
813 (d, $J = 15.6$ Hz, 1H), 7.83 (d, $J = 15.6$ Hz, 1H), 7.66 (dd, $J = 8.7, 5.4$ Hz, 2H), 7.15 (t, J
814 $= 8.7$ Hz, 2H), 4.82 (s, 2H), 4.10 - 4.04 (m, 2H), 4.03 - 3.97 (m, 2H). ^{13}C NMR (125
815 MHz, CDCl_3) δ 166.70, 165.56, 164.24 (d, $J_{c-f} = 250.75$ Hz), 151.71, 145.21, 130.78,
816 130.53, 117.00, 116.15 (d, $J_{c-f} = 21.88$ Hz), 43.92, 39.55, 38.99. HRMS (ESI) m/z
817 333.0402 $[\text{M}+\text{Na}]^+$ (calcd for 333.0413, $\text{C}_{14}\text{H}_{12}\text{ClFN}_2\text{NaO}_3$).

818 (*E*)-1-(3-(4-fluorophenyl) acryloyl)-3-(thiophene-2-carbonyl) imidazolidin-2-one (**6j**)

819 Yield 36%, white powder. m.p. 145-147 °C. ^1H NMR (500 MHz, CDCl_3) δ 7.91
820 (dd, $J = 3.9, 1.1$ Hz, 1H), 7.83 (s, 1H), 7.83 (s, 1H), 7.68 (dd, $J = 5.0, 1.1$ Hz, 1H), 7.59
821 (dd, $J = 8.7, 5.4$ Hz, 2H), 7.15 (dd, $J = 5.0, 3.9$ Hz, 1H), 7.06 (t, $J = 8.6$ Hz, 2H), 4.04
822 (d, $J = 1.4$ Hz, 4H). ^{13}C NMR (125 MHz, CDCl_3) δ 165.85, 164.26 (d, $J_{\text{c-f}}=250.50$
823 Hz), 162.82, 151.62, 144.68, 135.70, 134.83, 133.50, 130.91, 130.52, 127.36, 117.49,
824 116.02 (d, $J_{\text{c-f}}=250.50$ Hz), 40.65, 39.48. HRMS (ESI) m/z 345.0695 $[\text{M}+\text{H}]^+$ (calcd
825 for 345.0704, $\text{C}_{17}\text{H}_{13}\text{FN}_2\text{O}_3\text{S}$).

826 (*E*)-1-benzoyl-3-(3-(4-fluorophenyl) acryloyl) imidazolidin-2-one (**6k**)

827 Yield 34%, white powder. m.p. 210-212 °C. ^1H NMR (500 MHz, CDCl_3) δ 7.82
828 (d, $J = 15.7$ Hz, 1H), 7.71 (d, $J = 15.7$ Hz, 1H), 7.67 (d, $J = 7.5$ Hz, 2H), 7.60 - 7.52 (m,
829 3H), 7.47 (t, $J = 7.7$ Hz, 2H), 7.03 (t, $J = 8.6$ Hz, 2H), 4.06 (s, 4H). ^{13}C NMR (125
830 MHz, CDCl_3) δ 170.29, 165.83, 164.09 (d, $J_{\text{c-f}}=250.50$ Hz), 151.56, 144.74, 133.72,
831 132.24, 130.62, 130.55, 128.84, 127.98, 117.42, 115.95 (d, $J_{\text{c-f}}=21.75$ Hz), 40.10,
832 39.44. HRMS (ESI) m/z 339.1125 $[\text{M}+\text{H}]^+$ (calcd for 339.1139, $\text{C}_{19}\text{H}_{15}\text{FN}_2\text{O}_3$).

833 (*E*)-4-(3-(3-(4-fluorophenyl) acryloyl)-2-oxoimidazolidine-1-carbonyl) benzonitrile
834 (**6l**)

835 Yield 35%, white powder. m.p. 248-250 °C. ^1H NMR (500 MHz, CDCl_3) δ 7.83
836 (d, $J = 15.7$ Hz, 1H), 7.76 (d, $J = 8.3$ Hz, 2H), 7.71 (d, $J = 8.2$ Hz, 2H), 7.64 (d, $J =$
837 15.7 Hz, 1H), 7.54 (dd, $J = 8.6, 5.4$ Hz, 2H), 7.05 (t, $J = 8.6$ Hz, 2H), 4.07 (q, $J = 2.3$
838 Hz, 4H). ^{13}C NMR (125 MHz, CDCl_3) δ 168.55, 165.60, 164.20 (d, $J_{\text{c-f}}=250.75$ Hz),
839 151.34, 145.27, 137.89, 131.77, 130.67, 130.57, 129.11, 117.99, 116.93, 116.06 (d, J

840 $J_{c-f}=21.88$ Hz), 115.38, 39.78, 39.44. HRMS (ESI) m/z 386.0905 $[M+Na]^+$ (calcd for
841 386.0911, $C_{20}H_{14}FN_3NaO_3$).

842 N-ethyl-3-(3-(4-fluorophenyl)propanoyl)-N-methyl-2-oxoimidazolidine-1-carboxamid
843 e (**6m**)

844 Yield 30%, white powder. m.p. 156-158 °C. 1H NMR (600 MHz, $CDCl_3$) δ 7.21
845 (dd, $J = 8.3, 5.5$ Hz, 2H), 6.97 (t, $J = 8.7$ Hz, 2H), 3.87 (t, $J = 7.8$ Hz, 2H), 3.78 (d, $J =$
846 8.1 Hz, 2H), 3.44 (d, $J = 7.1$ Hz, 2H), 3.23 (t, $J = 7.6$ Hz, 2H), 3.00 (s, 3H), 2.97 (t, $J =$
847 7.6 Hz, 2H), 1.22 (d, $J = 7.2$ Hz, 3H). ^{13}C NMR (125 MHz, $CDCl_3$) δ 172.62, 161.43
848 (d, $J_{c-f}=242.38$ Hz), 153.71, 152.19, 136.39, 129.92, 115.13 (d, $J_{c-f}=21.00$ Hz), 41.69,
849 40.62, 39.72, 37.49, 29.62, 27.15, 12.31. HRMS (ESI) m/z 344.1383 $[M+Na]^+$ (calcd
850 for 344.1381, $C_{16}H_{20}FN_3O_3$).

^a Cell viability (%) of PC12 cells were detected by the MTT assay after 24 h of incubation with compounds at the concentration of 20 μ M with H₂O₂ (200 μ M) or

6-OHDA (150 μ M). Data are the mean \pm SD of three independent experiments.

Journal Pre-proof

Figure 1 Initial screening of PL analogues against 6-OHDA- or H₂O₂-induced PC12 cell damage. Data are the mean \pm SD of three independent experiments. (**p) \leq 0.01 compared with the control group; (^p) \leq 0.05 compared with H₂O₂-treated or 6-OHDA-treated group.

Figure 2. The docking models of icompond **1** (A) and **6** (B) with the BTB domain of Keap1 (PDB: 4CXT).

Figure 3 The expression of Nrf2 in PC12 cells after treatment with compounds **1** and **6**. (** $p \leq 0.05$), Data are presented by mean \pm SD (n = 3).

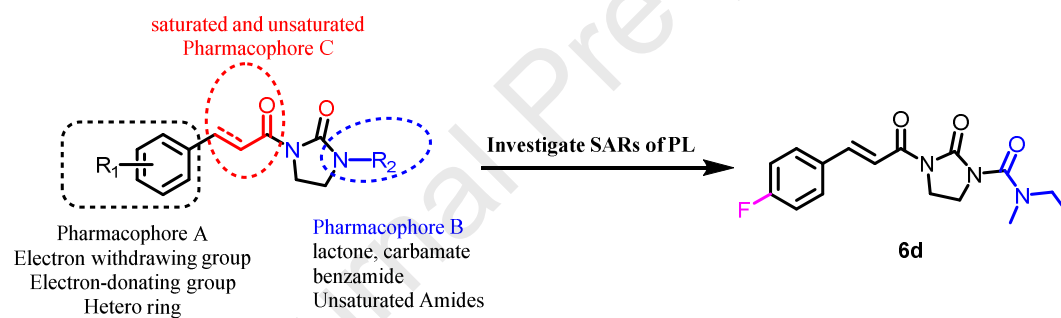

Figure 4 The design of the modifications of PL

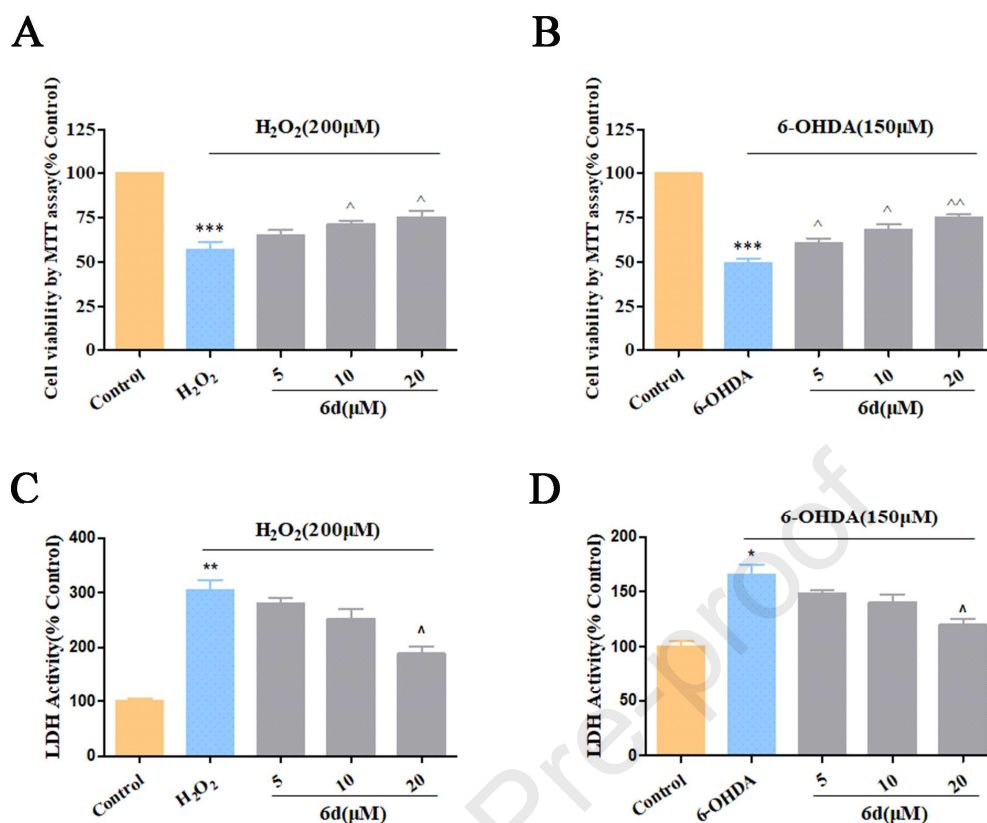

Figure 5. Protection of **6d** against H₂O₂- (A) and 6-OHDA-induced (B) PC12 cell damage, determined by MTT assay. Protection of **6d** against H₂O₂-induced (C) and 6-OHDA-induced (D) PC12 cell damage was measured by the LDH release assay. Data are the mean \pm SD of three independent experiments. (**p) \leq 0.01 and (***) \leq 0.001 compared with the control group; (^ p) \leq 0.05, (^^ p) \leq 0.01 and (^^^ p) \leq 0.001 compared with H₂O₂-treated or 6-OHDA-treated group.

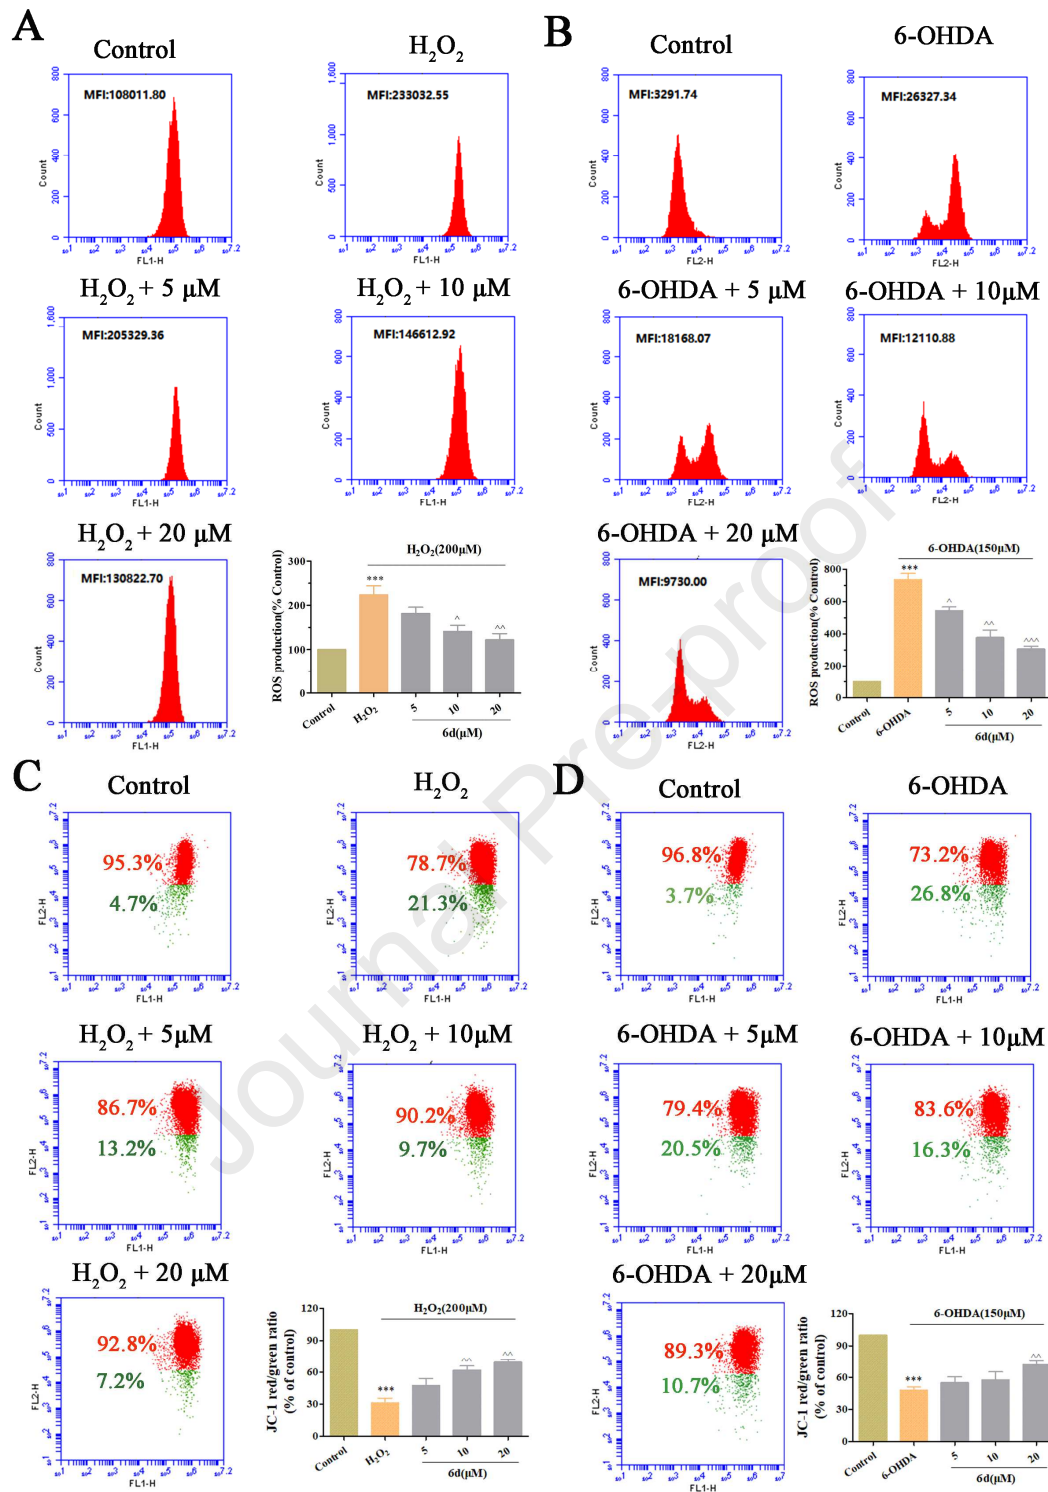

Figure 6. The effects of **6d** on H_2O_2 -induced (A) and 6-OHDA-induced (B) intracellular ROS production in PC12 cells. The cells were stained with DCFH-DA and immediately determined by flow cytometry. The effects of **6d** on

H₂O₂-induced (C) and 6-OHDA-induced (D) MMP reduction in PC12 cells. MMP were detected by flow cytometry after JC-1 staining. Data are presented by mean \pm SD (n = 3). (***) $p \leq 0.001$ compared with the control group; (\wedge) $p \leq 0.05$, ($\wedge\wedge$) $p \leq 0.01$ and ($\wedge\wedge\wedge$) $p \leq 0.001$ compared with H₂O₂-treated or 6-OHDA-treated group.

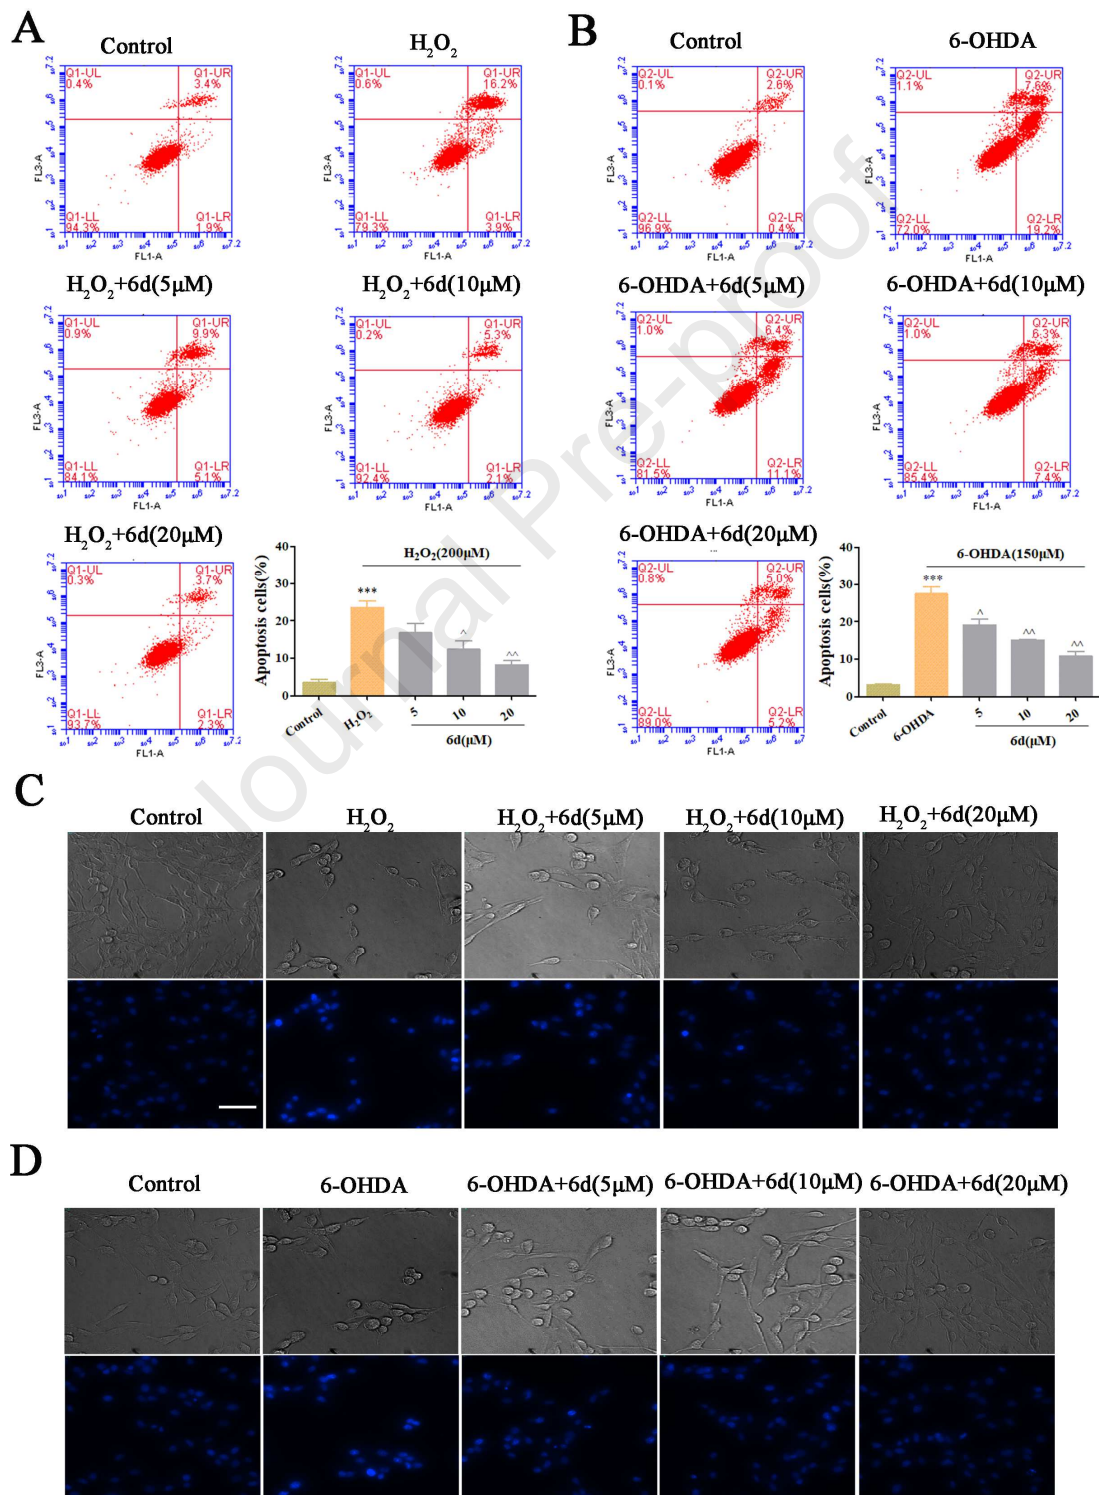

Figure 7. Prevention of PC12 cells from H₂O₂-induced (A) and 6-OHDA-induced (B) apoptosis by **6d**. Apoptotic cells were detected by flow cytometry after AnnexinV and PI double staining. (C, D) Images showed the apoptotic nuclei by Hoechst 33342 staining. The top panel is phase contrast pictures, and the bottom panel is fluorescent pictures. Scale bars: 100 μ m. Data are presented by mean \pm SD (n = 3). (***)p \leq 0.001 compared with the control group; (\hat{p}) \leq 0.05 and ($\hat{\wedge}$ p) \leq 0.01 compared with H₂O₂- or 6-OHDA-treated group.

Figure 8. Effects of **6d** on H₂O₂-induced (A) and 6-OHDA-induced (B) Ca²⁺ overload in PC12 cells. Data are presented by mean \pm SD (n = 3). (*)p \leq 0.05 and (***)p \leq 0.001 compared with the control group; (\hat{p}) \leq 0.05 and ($\hat{\wedge}$ p) \leq 0.01

compared with H₂O₂-treated or 6-OHDA-treated group.

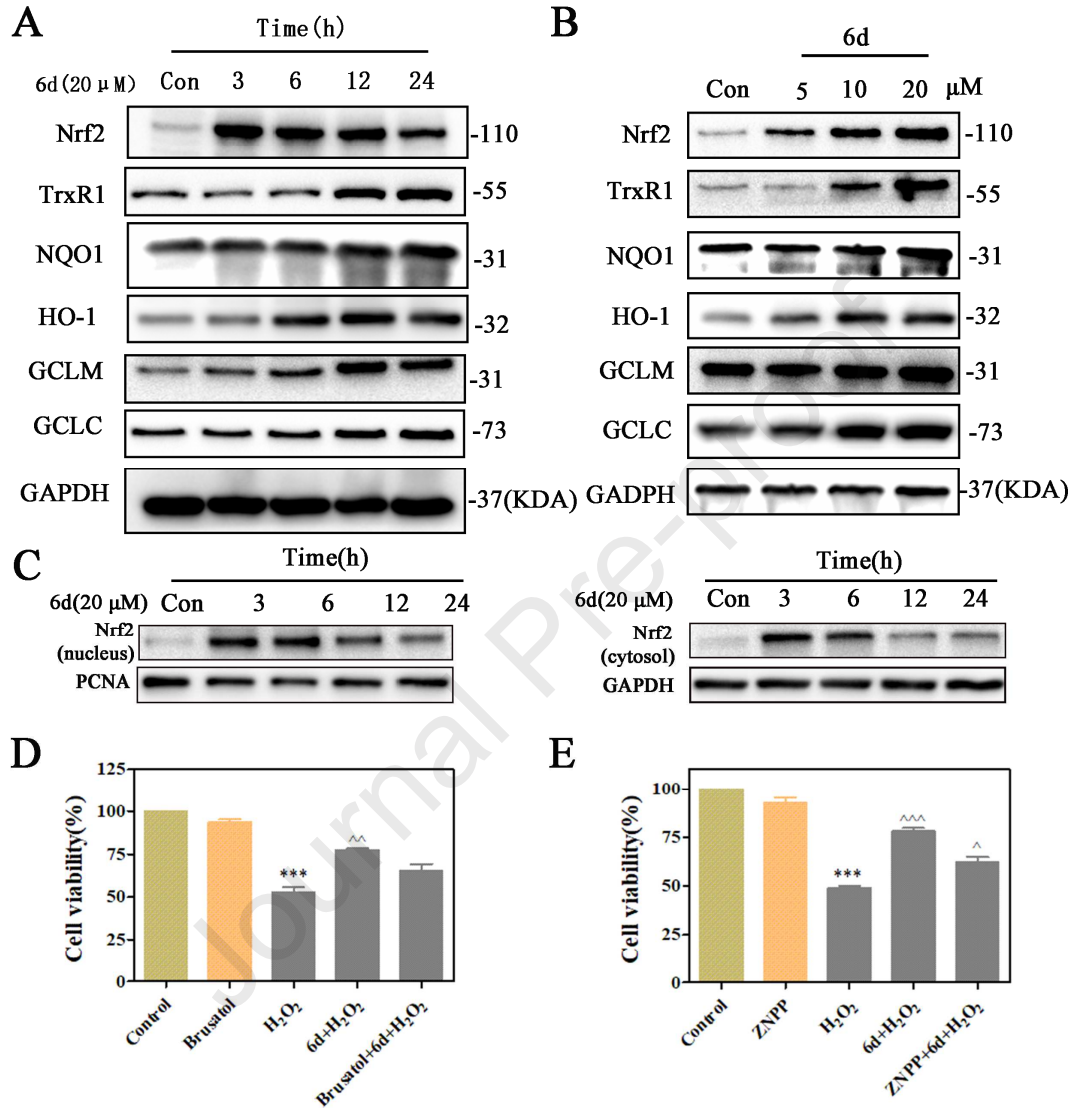

Figure 9. 6d could increase the expression of nuclear and cytosolic Nrf2, TrxR1, NQO-1, HO-1, GCLM and GCLC in a time (A) and dose (B) dependent manner. Promotion of Nrf2 nuclear accumulation by 6d (C). Brusatol (D), ZnPP (E) affected the protection of 6d. PC12 cells were incubated for 30 min in the presence of 6d (20 μM) together with brusatol (10 nM) or ZNPP (10 nM) prior to stimulation with H₂O₂ (150 μM) for 24 h, determined by MTT assay. Data are

presented by mean \pm SD (n = 3).

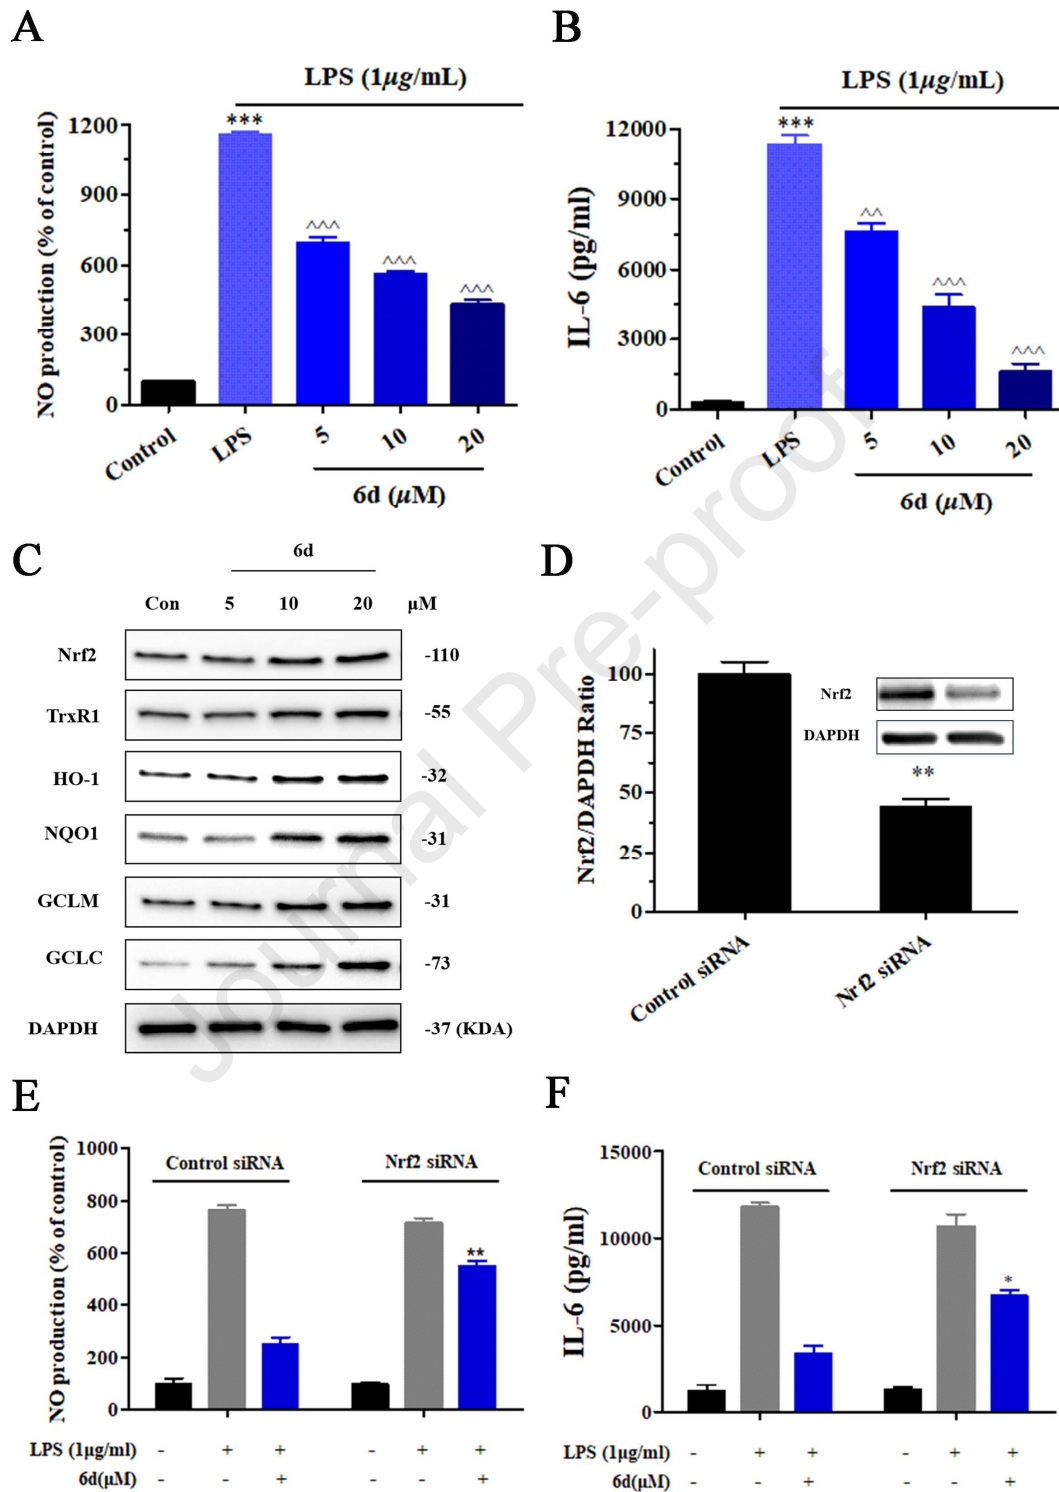

Figure 10. Contribution of Nrf2 to the anti-inflammatory effect of 6d. (A) 6d reduced the production of LPS-stimulated inflammatory mediators NO in BV2

microglia cells. (B) **6d** reduced the production of LPS-induced IL-6 in BV2 microglia cells. The levels of IL-6 were measured by ELISA kits. (C) **6d** dose dependently induced expression of Nrf2 and its downstream antioxidant proteins in BV2 microglia cells. (D) Nrf2 expression in Control siRNA- and Nrf2 siRNA-transfected BV2 microglia cells. (***) $p \leq 0.001$ compared with the control group; (\wedge) $p \leq 0.01$ and ($\wedge\wedge$) $p \leq 0.001$ compared with LPS-treated group. Transfection of BV2 microglia cells with Nrf2 siRNA reversed suppressive effects of **6d** (20 μ M) on NO (E), IL-6 (F) production following LPS stimulation. ** $p \leq 0.01$ and * $p \leq 0.05$ in comparison with control siRNA-transfected cells. Data are presented by mean \pm SD (n = 3).

Figure 11. The docking model of **6d** with representative CYS in Keap1. 3D image of covalent docking between **6d** and CYS151 in the BTB domain (PDB: 4CXT).

^a Reagents and conditions: (a) NaH, THF, 0 °C, 30min; (b) Trimethylacetyl chloride, TEA, DCM, 0 °C, 30min; (c) NaH, DCM, 0 °C, 30min.

Highlights

- A series of piperlongumine derivatives were synthesized as neuroprotective agents by structure-based design.
- **6d** showed potent protection on PC12 cells against 6-OHDA- and H₂O₂-induced cell damage, alleviated ROS accumulation, mitochondrial dysfunction, Ca²⁺ influx, and cell apoptosis. Meanwhile, **6d** also showed good anti-inflammatory activity.
- Mechanism study proved that **6d** could activate keap1/Nrf2 signaling pathway, and upregulate downstream antioxidant enzymes such as NQO1, HO-1, GCLC, GCLM, and TrxR1.
- The parallel artificial membrane permeability assay indicated that **6d** would be potent to cross the blood-brain barrier.

Identification and optimization of Piperlongumine analogues as potential antioxidant and anti-inflammatory agents via activation of Nrf2
