Step 1: Downloading and installing the firmware update

Type-C DATA cable required

1.

Turn the speaker ON, then connect it to your PC using a Type-C DATA cable.

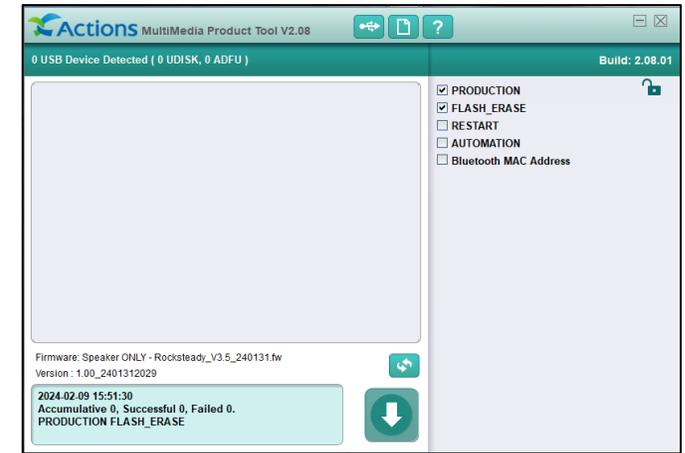

2.

Partially depress and tap the POWER button 15 times in quick succession.

(Follow the same process for the subwoofer and other B3B speakers)

3.

This down arrow icon will illuminate green when the connection is made.

Select the DOWN ARROW to install the firmware

Installation takes approx. 20 seconds.
The speaker will turn off when the installation is complete.

- 1. The speaker is not connecting to the software (the install down arrow does not turn green indicating a connection):**
 - If the speaker is not connecting to the software, repeat the process of tapping the power button 10-15 times (in other words... try again). If it still won't connect, then it is likely that your Type-C cable is not a DATA cable.
- 2. You can't pair your source device to the speakers after the firmware update.**
 - The Bluetooth ID name of the speaker will change after the firmware update. You will need to pair to this speaker and connect to the new device name (Rocksteady_XXXX).

What's new?

1. Newly developed cone drivers.
2. A new wireless system, including new antenna and drivers, for longer range and connectivity.
3. New processor, circuitry, and architecture
 - a) Runs cooler and lasts longer, now with 30 hours battery life per charge.
4. Dual EQ options
 - a) FULL MODE: Each speaker has a pleasing fullness that fills a room with smooth yet clear full sound.
 - b) CLEAR MODE, the speakers are tuned to approximate studio sound clarity.
 - c) The Rocksteady Stadium subwoofer also features 2 EQ options, optimized for each speaker sound profile; or mix and match.
5. Overall and general fixes and updates.
