

# NO MORE DRY HANDS

**B**efore Covid, we rarely used hand sanitiser; now it's the must-have accessory of 2020. Whether you're heading to a restaurant, for a night out (remember those!?) or even just to a friend's house (when we can), it's in your pocket.

But with this endless destruction of germs comes severely dry and cracked skin. Look at your palms now and we bet it's like staring at the Gobi desert.

The answer? A hand sanitiser that moisturises. Or, in fact, a moisturiser that hand sanitises. It's so simple we're upset we didn't think of it ourselves and patent the technology. Instead, Surrey residents Matthew Jenner and Tom Wanless got there first, creating Babington Soap Co.

We've used hand sanitisers for so long, no one is willing to give them up. Surveys show nearly 80% of people expect to continue using hand sanitiser once a vaccine has become effective. And more than 60% of people think that the use of hand sanitisers has had, or may eventually have, a detrimental effect on the skin and accelerate ageing on the hands. If we're not already worried about liver spots and wrinkles, now we've got something else to add to our list!

Sanitisers are generally pretty bad for our skin. They're

not designed to be cosmetics. You normally find them in hospital waiting rooms or in a gap-year student's bumbag. So it's important that we start plumping up our skin with the right stuff instead of destroying the skin's natural barrier with potent liquids.

Babington Soap Co. is designed to be a cosmetic and part of your daily skin care routine and provide protection against bad bacteria at the same time. The vegan-friendly plant-based moisturiser uses just six natural ingredients.

Almost every sanitiser (whether it's super pricey or straight from the high street) uses aloe vera or glycerine whereas Babington Soap Co. uniquely uses chitosan (pronounced "kite-o-san"). The pharmaceutical-grade plant-based ingredient locks in the skin cells' water stores to ensure smooth, healthy skin. Unlike the other moisturisers, the chitosan in Babington Soap Co. products mimics the body's natural moisturisation functions by forming an impermeable barrier to prevent water loss from the skin cells. Through this process, the skin cells continue to operate exactly how nature intended; most importantly, it leaves your hands feeling soft and silky smooth.

This is the kind of moisturising hand sanitiser that's a treat, with a gorgeous lemongrass scent.

It's as gorgeous as bath bombs or scented candles and comes in beautiful packaging, making it perfect for a gift this festive season. If we're going to be using hand sanitiser long after we're out of this pandemic, we might as well make it the right one. ■
