

Test Basic on Firmware version v1.6

Introduction

This article is a test report for Dragino LSN50 LoRa Sensor Node power consumption. It is to provide reference for system integrator to install the sensor node.

With the test result here, system integrator can estimate the battery life time for LSN50.

目录

Introduction	2
1. Test Result	4
1.1 Watchdog Power	4
1.2 MOD=1	4
1.2 MOD=2(3VHP)	6
1.3 MOD=2(JSN)	7
1.4 MOD=3	9
1.5 MOD=4	10
1.6 MOD=5	12

1. Test Result

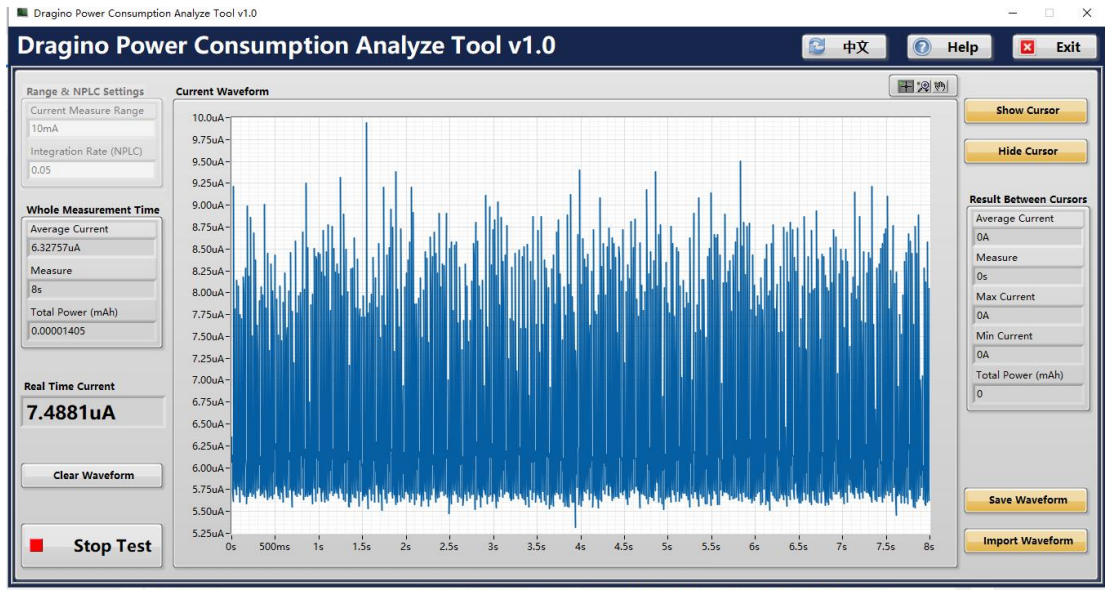

1.1 Watchdog Power

Max 10mA Average 5.5429mA in 1ms for every 18 seconds (watchdog period)

1.2 MOD=1

Deep Sleep Mode
Average: 8uA

send data

Transmit Time: 4s

Average Current in transmit time: 4.89591mA

The total current to send a packet is

$$4.8959\text{mA} * 4\text{s} = 19.58364\text{mA}$$

Analyze Result

With Above test result and battery info, we can estimate the battery life.

and let is working in set up DR=5. Transmit one uplink every 20 minutes.

✓ Deep Sleep Mode Current : $8\mu\text{A} * 20 * 60$ (10.32mA)

- ✓ Watch Dog Current: $0.001 * 10 * 20 * 60 / 18$ (0.67mA)
- ✓ The total current to send a packet is : 19.58364mA

So total Average Current is : $(19.58364 + 10.32 + 0.67) / (20 * 60) = 0.025478\text{mA}$.

The battery used in LSN50 is 4000mAh and of stable voltage in the most of life. With considering a max 2% discharge rate from the battery spec. So the battery life is y. so

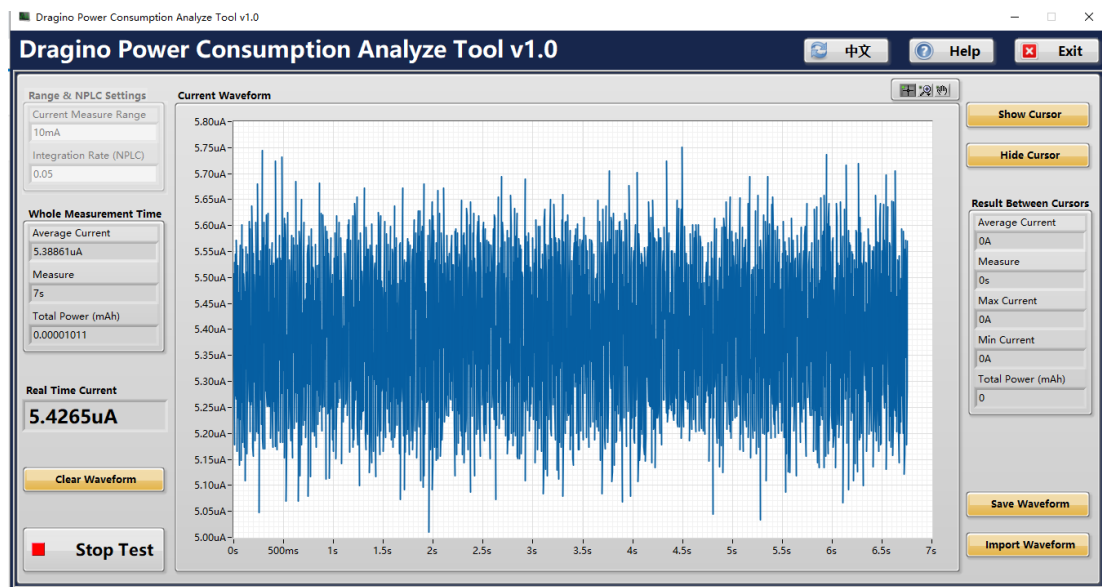

$$4000(1 - 2\% * y) = 0.025478\text{mA} * 24 * 365 * y$$

$$\text{So } Y = 4000 / (0.025478 * 24 * 365 + 80) = 13.1(\text{Years})$$

1.2 MOD=2(3VHP)

Deep Sleep Mode

Average: 6uA

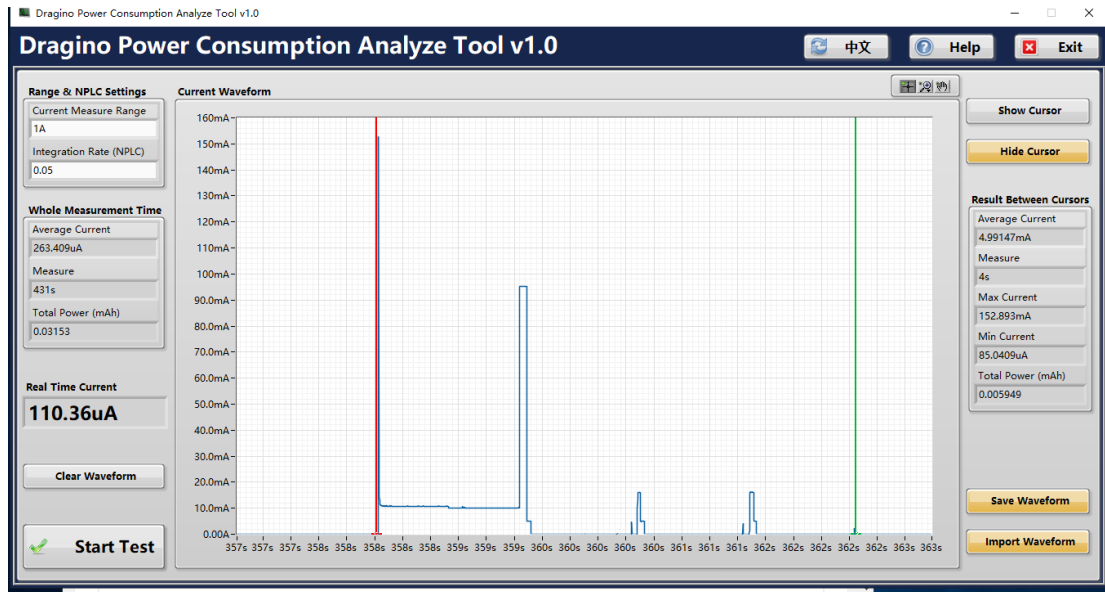

send data

Transmit Time: 4s

Average Current in transmit time: 4.99147mA

The total current to send a packet is

$$4.99147\text{mA} * 4\text{s} = 19.96588\text{mA}$$

Analyze Result

With Above test result and battery info, we can estimate the battery life. and let is working in set up DR=5. Transmit one uplink every 20 minutes.

- ✓ Deep Sleep Mode Current : $6\mu\text{A} * 20 * 60$ (7.2mA)
- ✓ Watch Dog Current: $0.001 * 10 * 20 * 60 / 18$ (0.67mA)
- ✓ The total current to send a packet is : 19.96588mA

So **total Average Current is : $(19.96588 + 7.2 + 0.67) / (20 * 60) = 0.023197\text{mA}$.**

The battery used in LSN50 is 4000mAh and of stable voltage in the most of life. With considering a max 2% discharge rate from the battery spec. So the battery life is y. so

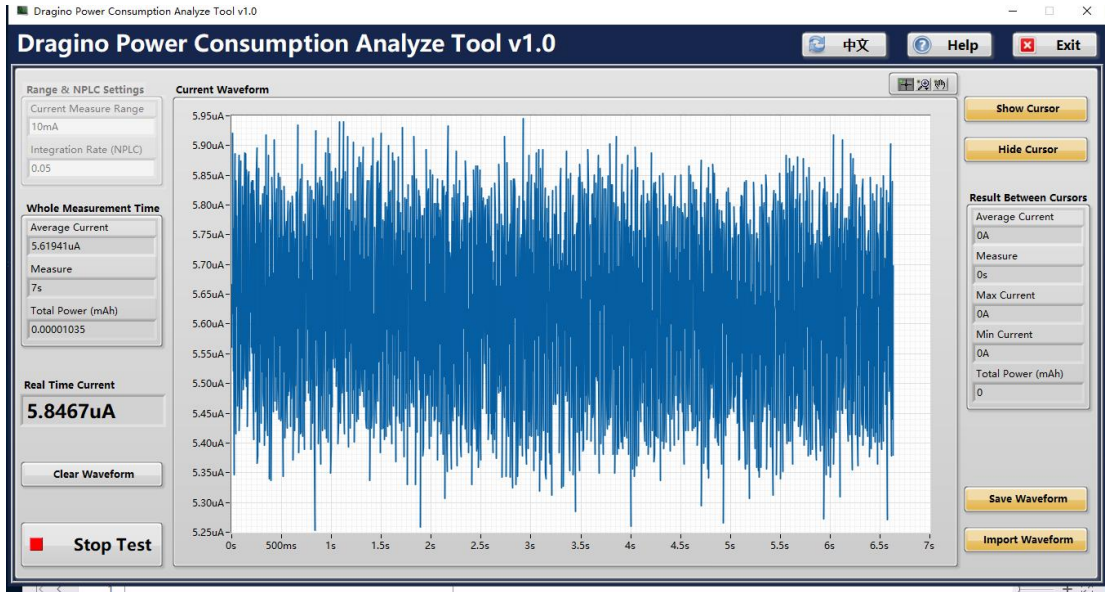

$$4000(1 - 2\% * y) = 0.023197\text{mA} * 24 * 365 * y$$

$$\text{So } Y = 4000 / (0.023197 * 24 * 365 + 80) = 14.1(\text{Years})$$

1.3 MOD=2(JSN)

Deep Sleep Mode

Average: 6uA

send data

Transmit Time: 4s

Average Current in transmit time: 8.96mA

The total current to send a packet is

$$8.96\text{mA} * 4\text{s} = 35.84\text{mA}$$

Analyze Result

With Above test result and battery info, we can estimate the battery life.

and let is working in set up DR=5. Transmit one uplink every 20 minutes.

✓ Deep Sleep Mode Current : $6\text{uA} * 20 * 60$ (7.2mA)

- ✓ Watch Dog Current: $0.001 * 10 * 20 * 60 / 18$ (0.67mA)
- ✓ The total current to send a packet is : 35.84mA

So total Average Current is : $(35.84 + 7.2 + 0.67) / (20 * 60) = 0.036425\text{mA}$.

The battery used in LSN50 is 4000mAh and of stable voltage in the most of life. With considering a max 2% discharge rate from the battery spec. So the battery life is y. so

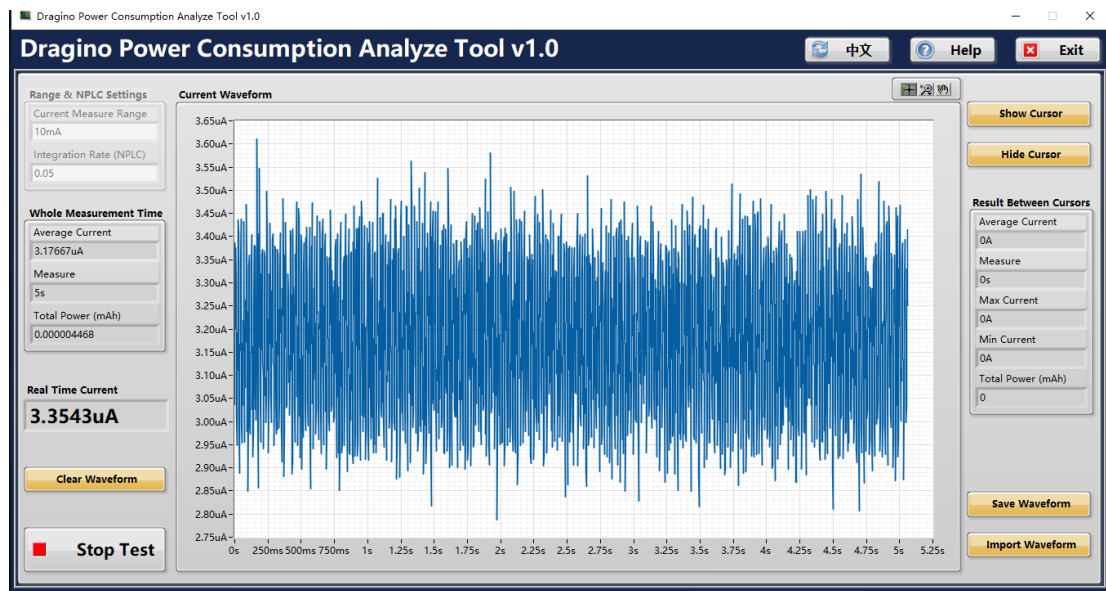

$$4000(1 - 2\% * y) = 0.036425\text{mA} * 24 * 365 * y$$

$$\text{So } Y = 4000 / (0.036425 * 24 * 365 + 80) = 10.0(\text{Years})$$

1.4 MOD=3

Deep Sleep Mode

Average: 4uA

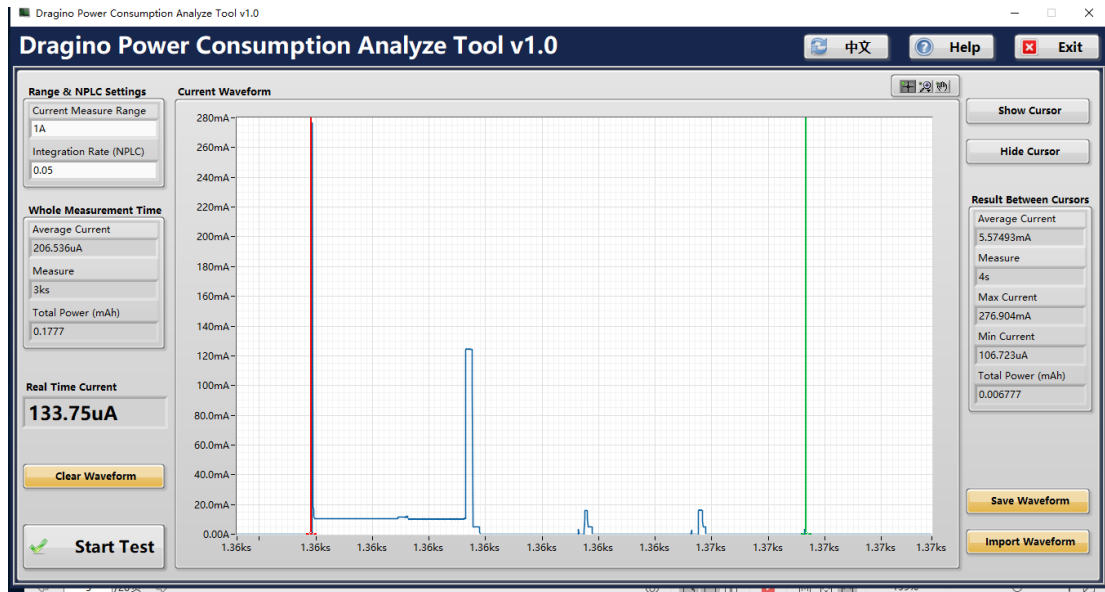

send data

Transmit Time: 4s

Average Current in transmit time: 8.96mA

The total current to send a packet is

$$8.96\text{mA} * 4\text{s} = 35.84\text{mA}$$

Analyze Result

With Above test result and battery info, we can estimate the battery life. and let is working in set up DR=5. Transmit one uplink every 20 minutes.

- ✓ Deep Sleep Mode Current : $4\mu\text{A} \times 20 \times 60$ (4.8mA)
- ✓ Watch Dog Current: $0.001 \times 10 \times 20 \times 60 / 18$ (0.67mA)
- ✓ The total current to send a packet is : 35.84mA

So **total Average Current is** : $(35.84 + 4.8 + 0.67) / (20 \times 60) = 0.034425\text{mA}$.

The battery used in LSN50 is 4000mAh and of stable voltage in the most of life. With considering a max 2% discharge rate from the battery spec. So the battery life is y. so

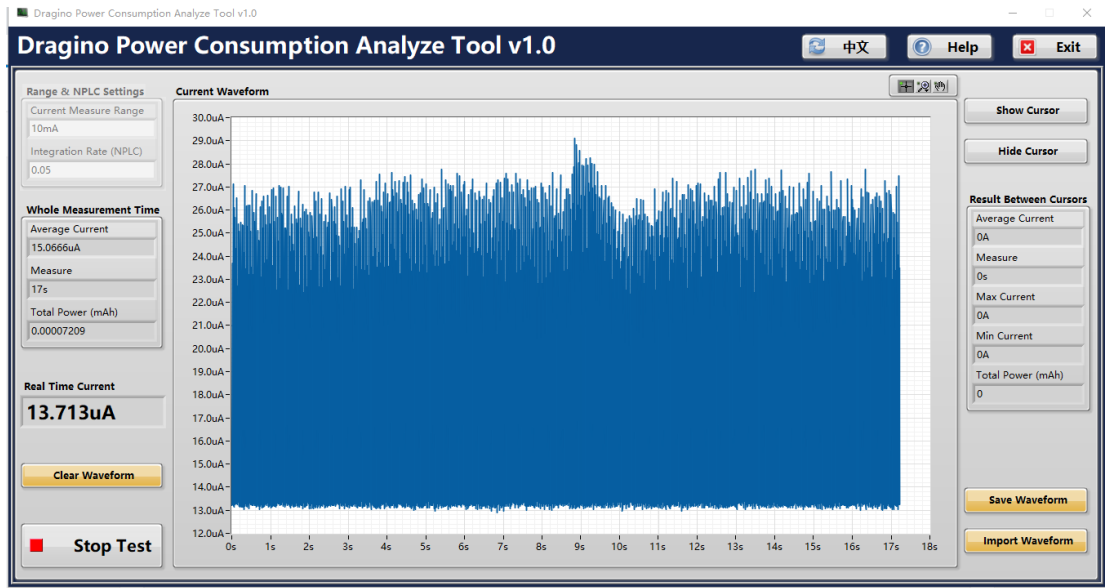

$$4000(1 - 2\% \cdot y) = 0.034425\text{mA} \times 24 \times 365 \times y$$

$$\text{So } Y = 4000 / (0.034425 \times 24 \times 365 + 80) = 10.4(\text{Years})$$

1.5 MOD=4

Deep Sleep Mode

Average: 14uA

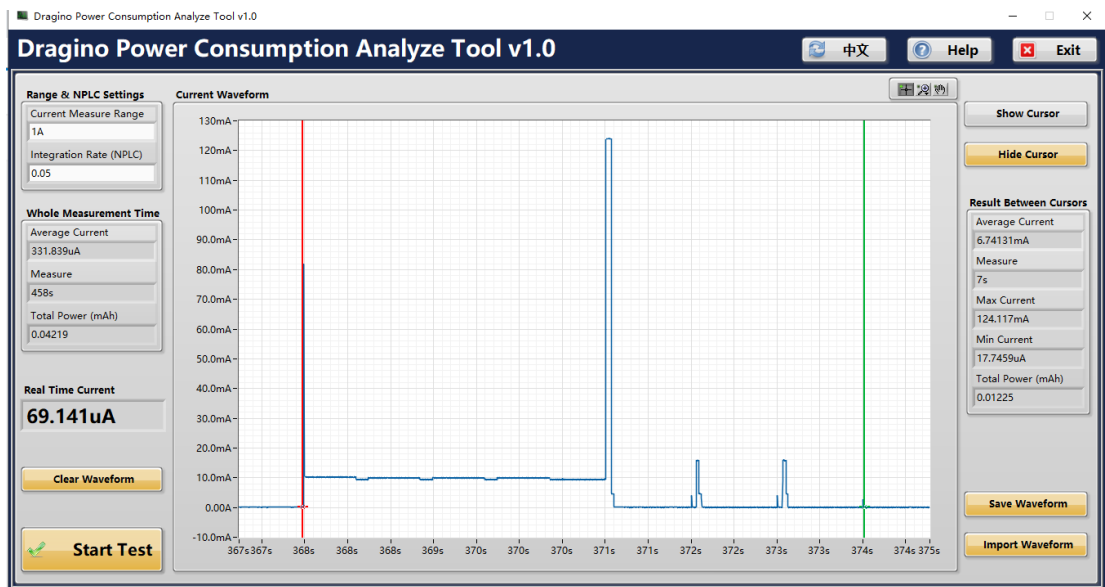

send data

Transmit Time: 7s

Average Current in transmit time: 6.74131mA

The total current to send a packet is

$$6.74131\text{mA} * 7\text{s} = 47.18917\text{mA}$$

Analyze Result

With Above test result and battery info, we can estimate the battery life.

and let is working in set up DR=5. Transmit one uplink every 20 minutes.

✓ Deep Sleep Mode Current : $14\text{uA} * 20 * 60$ (16.8mA)

- ✓ Watch Dog Current: $0.001 * 10 * 20 * 60 / 18$ (0.67mA)
- ✓ The total current to send a packet is : 47.18917mA

So total Average Current is : $(47.18917 + 16.8 + 0.67) / (20 * 60) = 0.053877\text{mA}$.

The battery used in LSN50 is 4000mAh and of stable voltage in the most of life. With considering a max 2% discharge rate from the battery spec. So the battery life is y. so

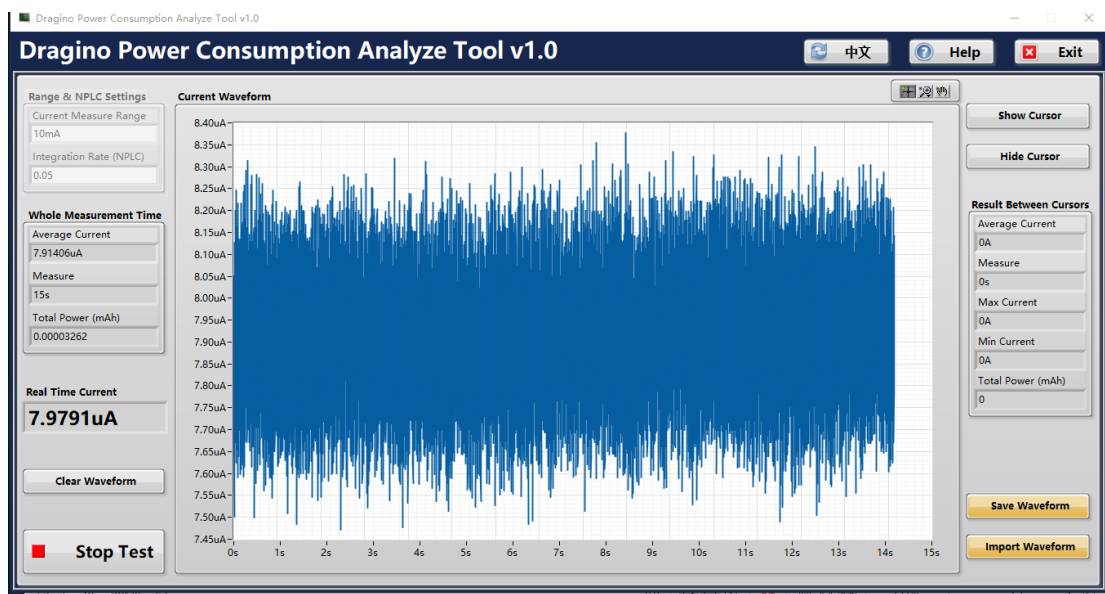

$$4000(1 - 2\% * y) = 0.053877\text{mA} * 24 * 365 * y$$

$$\text{So } Y = 4000 / (0.053877 * 24 * 365 + 80) = 7.2(\text{Years})$$

1.6 MOD=5

Deep Sleep Mode

Average: 8uA

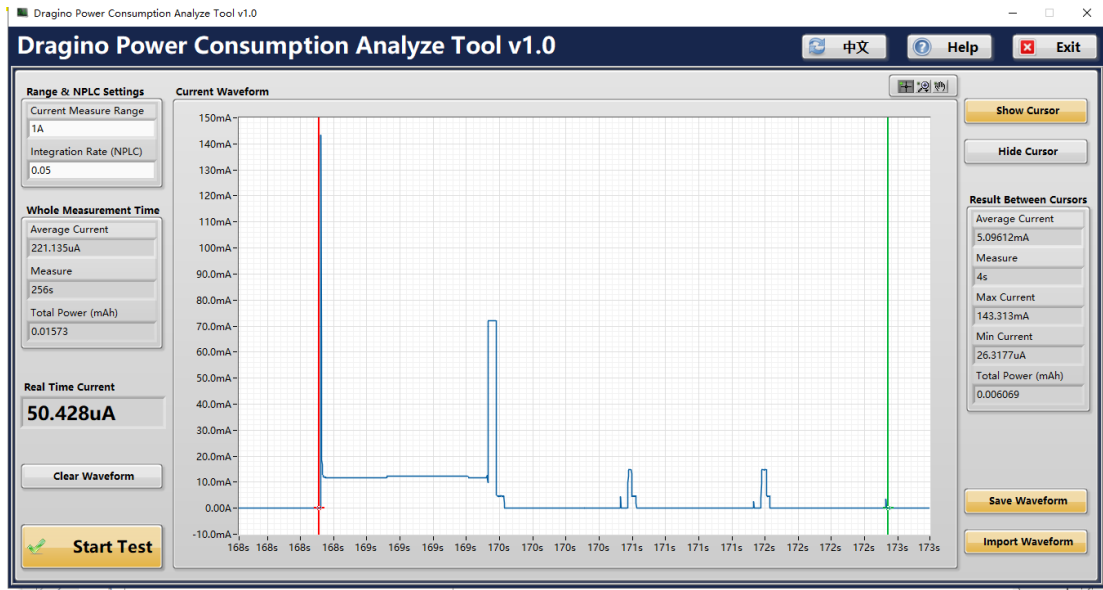

send data

Transmit Time: 4s

Average Current in transmit time: 5.09612mA

The total current to send a packet is

$$5.06912\text{mA} * 4\text{s} = 20.27648\text{mA}$$

Analyze Result

With Above test result and battery info, we can estimate the battery life. and let is working in set up DR=5. Transmit one uplink every 20 minutes.

- ✓ Deep Sleep Mode Current : $8\mu\text{A} \times 20 \times 60$ (10.32mA)
- ✓ Watch Dog Current: $0.001 \times 10 \times 20 \times 60 / 18$ (0.67mA)
- ✓ The total current to send a packet is : 20.27648mA

So **total Average Current is** : $(20.27648 + 10.32 + 0.67) / (20 \times 60) = 0.026055\text{mA}$.

The battery used in LSN50 is 4000mAh and of stable voltage in the most of life. With considering a max 2% discharge rate from the battery spec. So the battery life is y. so

$$4000(1 - 2\% \cdot y) = 0.026055\text{mA} \cdot 24 \cdot 365 \cdot y$$

$$\text{So } Y = 4000 / (0.026055 \cdot 24 \cdot 365 + 80) = 12.9(\text{Years})$$
