TESTING THE BRAKES

Do not attempt to operate the vehicle until the system has been fully tested under controlled conditions in a safe location. After the system has been bled, checked for leaks, and the proper pedal/lever resistance and travel have been determined, make a series of low speed stops, then gradually progress to normal operating speeds.

CRITICAL BRAKE INFORMATION

Install in accordance with vehicle manufacturer's service manual.

Make sure pedal/lever is firm: Hold firm pressure on pedal/lever for several minutes, it should remain in position without sinking. If pedal/lever sinks during hold, check system for fluid leaks. DO NOT drive vehicle if pedal/lever does not stay firm or can be pushed to the floor/handlebar with normal pressure.

At very low speed (2-5 mph) apply brakes hard several times while turning steering from full left to full right, repeat several times. Review the brake and brake line packaging area and check that components are not touching, rubbing, or leaking.

Carefully examine all brake components, brake lines, and fittings for leaks and interference.

Make sure there is no interference with wheels or suspension components.

- Drive vehicle at low speed (15-20 mph) making moderate and hard stops. Brakes should feel normal and positive. Again check for leaks and interference.
- Always test vehicle in a safe place where there is no danger to (or from) other people or vehicles.
- Always make use of all safety equipment.
