ERLER ZIMMER

NEW: Canine Intubation Head

This realistic training phantom is ideal for practicing the procedure and techniques involved in endotracheal intubation. The tongue is flexible. The teeth are made of hard plastic, so a tooth spreader can also be used. Epiglottitis and soft palate are present. The dog's head is mounted on a base. The base is designed in such a way that you can intubate in upright as well as in a lying (supine) position. The stand also offers a success check if the intubation is carried out correctly. A clamp included in the scope of delivery offers a firm stand.

Length: 45 cm
Width: 31 cm
Height: 27 cm
Weight: 3.5 kg
