

A48-1

A48-1 Bronchus and Blood Vessels

Mounted on a base in natural size. This model shows in detail the relation between the bronchus and the pulmonary arteries and veins. You can see clearly how the arteries and veins are distributed to the right and left lungs. There is some difference between one person and another in the distribution of the bronchus and blood vessels in the lungs, but this model is based on those generally found in many cases. This model will serve as a good guidance of surgical operation and taking a roentgenogram, and as a teaching instrument for medical students.
