

## Wall coating maintenance

### **Care advice for fabric and non-woven wallcoverings**

In order to maintain the wallcovering, please refer to the technical file to check its composition and thus choose the best cleaning technique.

1. Firstly, check that a cleaning agent can be used on the material, by carrying out a small test on an inconspicuous area. Some products may weaken or attack the fibres.
2. The surface should be cleaned as soon as possible. If you act quickly, a cloth soaked in mineral water may be enough to remove most marks or dirt, particularly if the surface has been treated with an anti-stain or anti-dirt treatment.
3. Any dust coating must be removed.
4. A mark or dirt should be wiped gently using a circular movement, working from the outside to the inside of the affected area.
5. Never rub a liquid mark. Absorb as much as possible using a sponge, absorbent paper or a cloth.
6. If the mark or dirt is thick, crusty or solid, it must be carefully removed using a spoon or spatula before attempting to use any water or cleaner. Avoid using a knife, as this could be dangerous.
7. One final piece of advice: use cold water or tepid water! Hot water engrains stains and fixes them in place.
