

TRIPLE BOND REPAIR

Reconnect. Reinforce. Restore.

Each hair strand is made from chains of keratin held together by millions of the three primary bond types. Once these bonds are broken – your damaged hair may feel dry, frizzy, brittle and prone to breakage.

This treatment reconnects, replaces, and reinforces the bonds in the hair, reversing damage from chemical services, heat styling, and environmental stress – all in five minutes.

Disulfide Bonds

Essential for strength and structure, but can be broken by hot tool styling, bleach, and chemical services.

Hydrogen Bonds

Are very fragile and can easily break with excess heat and humidity leading to frizz and split ends.

Salt Bonds

Slightly stronger than Hydrogen bonds, determine elasticity and can break when hair is wet or exposed to pH change.
