

Air Cleaning 101: Ionizers, Scrubbers & Purifiers

Ionizers

- Charges the dust and debris in the air, making it heavy so it falls to the ground more quickly
 - Air ionizers are designed for use in any size of space. The air is cleared by weighting particles and knocking them to the ground rapidly. This allows for prompt cleanup of a work area.
 - One of the biggest benefits of air ionizers is that they do not pull air through filters as the primary means of cleaning. This means there is less maintenance and filter cleaning for the end user.

Air Scrubber

Air Purifier

- Air scrubbers and air purifiers permanently remove contaminants through the use of filters
 - Air scrubbers are an industrial air purification system that remove gases or particles from the air. Scrubbers are commonly used to clean industrial exhaust & gas emissions
 - Air purifiers are filter based air cleaners. Commercial and industrial air purifiers are meant to be used to remove particulates or gasses in jobs like mold abatement, restoration, manufacturing, office renovations and more
