## NOTE:

Holding surfaces of the ULTRAnchor have purposely designed as they are not very big. Because, big holding surface doesn't actually mean higher holding capacity.

Anchors with bigger holding surfaces are having problems on catching the bottom and penetrate deeper. It is obvious that the anchor couldn't catch the bottom cannot function.

Based on these reasons, while designing the ULTRAnchor, we gave the priority on improving the catching features of the ULTRAnchor.

The studies made under this point of view resulted in designing a unique tip form.

This unique tip form helps ULTRAnchor catch the bottom immediately and penetrate deeper as the load increases.

ULTRAnchor performs better than all known anchors by these features.
